

Delirium Tremens

Delirium tremens (DTs) is one of the most severe results of alcohol withdrawal. Delirium tremens is also referred to as Alcohol withdrawal syndrome (AWS) is a set of symptoms that occur when someone who is physically dependent upon alcohol suddenly stops drinking or drastically reduces their alcohol intake. They are a medical emergency and not to be taken lightly or ignored. Delirium tremens occur after a period of heavy drinking, typically in those with a history of chronic alcohol use and those who have previously experienced severe alcohol withdrawal symptoms. It can be described as sudden, often severe, mental and nervous system changes resulting from ceasing alcohol beverages after periods of heavy drinking. It is a rare, life-threatening condition and it doesn't occur in everyone who withdraws from alcohol.

Delirium tremens result from prolonged periods of heavy drinking. Unlike an episode of binge drinking, which involves drinking large amounts of alcohol:

*5 or more drinks for men

*4 or more drinks for women

This occurs in a 2-hour period. Delirium tremens result from heavy drinking that occurs for many days over long periods of time. People who drink very large amounts of alcohol daily for at least several months are more likely to develop DTs. The longer you drink regularly, the higher your risk for developing DTs.

Assessment of DTs include the following:

*Assessment of severity of alcohol withdrawal

*Evaluation of delirium

*Screening for underlying medical morbidities

Liver disease as a co-morbidity is very common in patients with delirium tremens and that could complicate the clinical presentation, determine the treatment choice, and influence the outcome. DTs should always be treated as a medical emergency, as it can be fatal if left untreated. Death commonly results from:

*An ability to effectively regulate body temperature

*Abnormal heart rhythms

*Worsening of seizures due to alcohol withdrawal

*Exacerbation of existing medical issues

Delirium Tremens-History

In the United States, doctors prescribed Holy Flower as a treatment for delirium tremens up until 1941, when the possession and use of Holy Flower became illegal. Delirium tremens is a well-documented condition that has been known since the late 1700s. It wasn't until 1813 however that the name "delirium tremens" was ascribed to the condition. In the past, there was

very little to be done for patients with DTs other than to ensure that they did not hurt themselves or others. Early treatments for DTs included some of the following:

- *Lumbar punctures
- *Hydrotherapy
- *Morphine
- *Chloroform
- *Chloral hydrate
- *Insulin coma therapy
- *Electroconvulsive shock therapy

Delirium Tremens-Statistics

One of the issues associated with gathering data and statistical information about delirium tremens is the wide language used to identify and diagnose the condition as well as the criteria various medical centers use to confirm a diagnosis of withdrawal delirium.

-It is estimated that about half of the people who abuse alcohol will experience withdrawal symptoms, only a handful (at most 5%) of those people will exhibit symptoms of DTs.

-In 2019, 14.5 million Americans aged 12 or older were diagnosed with an alcohol use disorder

-At least half of the individuals experience some symptoms of withdrawal when they stop or dramatically reduce their alcohol intake.

-Of the individuals that go through alcohol withdrawal, only 3-5% of people develop severe withdrawal symptoms, such as:

*Seizures

*DTs

-Delirium tremens have a high mortality rate with between 1-4% of patients hospitalized with the condition dying as a result.

-Death occurs in between 5-25% of people who develop DTs

*This includes individuals who were not hospitalized

-That figure is substantially lower than previous mortality rates 37% of patients who experienced alcohol withdrawal syndrome in the early 20th century

-The National Center for Biotechnology Information (NCBI) reports that DTs occurs in less than 5% of people with untreated acute alcohol withdrawal.

-Medscape reports that between 30 & 40% of people who experience alcohol withdrawal seizures go on to experience DTs.

-Without proper treatment, DTs can have a mortality rate of up to 37%.

-The latest Global Status Report on Alcohol and Health, published in 2014 reported that the more than one third of the population (38.3%) of the world can be categorized as current drinkers 38.3%.

-Globally, alcohol is responsible for around 3.3 million deaths annually.

-5.9% of global mortality and 5.1% of the Disability Adjusted Life Years (DALY) could be attributed to alcohol consumption.

-Surprising, death due to:

*HIV/AIDs

*Tuberculosis

*Violence

All together could not match the figure due to alcohol use

-Twenty-five of the chronic disease or condition codes in the International Classification of Diseases (ICD-10) are directly linked to alcohol and for many others link:

*Cardiac

*Digestive

*Neuro-psychiatric

Diseases and tumors play the role of component casualty

-Alcohol use is projected to contribute to 20-50% of cirrhosis of the liver poisonings, epilepsy, roadside accidents, several types of cancer, and violence.

-All the alcohol related harmful consequences are more in people with alcohol use disorders (AUD) who drink heavily. The worldwide prevalence of current AUD is up to 14%.

-According to the Centers for Disease Control and Prevention, about 88,000 Americans died in the United States each year between 2006 and 2010 because of alcohol.

-Delirium tremens is the cause of death of one of five alcoholics who tried it.

Delirium Tremens-Reducing the Risk of Alcohol Related Liver Disease

Unfortunately, most alcoholics who develop cirrhosis and liver failure do not notice symptoms until it is too late, and the damage is already done. This makes it immensely important to reduce the risk of liver damage. One obvious way to reduce the risk of liver damage is to cut down or even give up alcohol. All liver diseases improve in the absence of alcohol. In addition, an individual can reverse and avoid future fatty liver damage by not consuming alcohol.

Unfortunately, there is no cure for cirrhosis, but cutting out alcohol for good enhances an individual's chance of survival. In fact, the individuals can live for decades with cirrhosis if they give up alcohol in time. Other aspects that reduce that impact of liver disease include:

*Maintaining a healthy weight

*Not smoking

*Getting regular, adequate, and healthy exercise

*Eating a balanced diet and avoiding processed food

*Drinking coffee

*Getting sunlight (a low Vitamin D is bad for liver diseases)

Importance of Early Intervention

Additionally, people with alcohol withdrawal delirium are also at increased risk of injuries from falling during seizure, injuring themselves or someone else while confused, and developing an irregular heartbeat. Early treatment for alcohol withdrawal is essential since treatment significantly lowers the risks of complications and death.

With progressive medical treatment, alcohol withdrawal delirium has a very low death rate.

Some symptoms of alcohol withdrawal do last for more than a year, often including:

*Mood swings

*Fatigue

*Sleeplessness

The positive news is that if someone seeks assistance early enough, many of these complications can be reduced.

Delirium Tremens Causes

The primary component for delirium tremens is a history of heavy alcohol use. Over time, your body becomes dependent on alcohol when you consume large amounts of it daily. Your central nervous system and certain parts of your brain are not able to compensate quickly when the supply of alcohol suddenly stops or is greatly reduced without any warning.

People who drink in excess often experience alcohol withdrawal delirium when they:

- *Stop drinking suddenly
- *Reduce alcohol intake too fast
- *Fail to eat enough food while reducing alcohol consumption
- *Sustain head injuries
- *Get sick
- *Develop infections

Some people are at a greater risk for developing DTs including people who have:

- *Consumed large amounts of alcohol regularly for years
- *Have histories of alcohol withdrawal
- *Experienced DTs in the past
- *Passed the age of 30
- *Have co-occurring health problems that exacerbate delirium tremens
- *Have a history of seizure disorders
- *Experienced withdrawal seizures
- *Incurred other brain damage

If you suspect DTs in yourself or a loved one based on the information above, seek emergency medical help right away.

Delirium Tremens-Physical Effects

All delirium tremens symptoms are related to the central nervous system hyperactivity. Some individuals experience seizures, which usually occur as:

- *Single seizure
- *A flurry of seizures that occur in a short time span

Death from delirium tremens is usually the result of one of the following:

- *Arrhythmia
- *Complicating illness
- *Failure to identify underlying problems
- *Older age
- *Elevated core body temperature
- *Co-occurring liver disease
- *Pre-existing cardio-pulmonary disease

o

Medical supervision while going through withdrawal delirium dramatically reduces, though cannot eliminate, the risk of death.

Delirium Tremens-Mental Effects

While delirium tremens is a serious medical condition, it also indicates a long-term dependence on high volumes of alcohol consumption routinely. This type of alcohol use or abuse is associated with alcoholism, a condition that may require intervention in the form of medical rehab to control the symptoms of delirium tremens while treating the addiction of alcohol.

Immediate mental effects of DTs include:

- *Global confusion
- *Disorientation
- *Hallucinations
- *Agitation

There may be co-occurring illnesses along with addiction, as well as many health issues related to prolonged periods of high-volume alcohol consumption, including mental health issues that may be, as of yet, undiagnosed.

Delirium Tremens-Complications

Alcohol withdrawal delirium, also known as delirium tremens, is rare for alcoholics but can lead to complications during alcohol withdrawal. In fact, in cases of severe alcoholism and intense alcohol withdrawal, complications can require professional treatment. Alcohol withdrawal delirium is usually only experienced by heavy drinkers, but the consequences can be fatal.

Complications of alcohol withdrawal delirium include:

- *Alcohol-related liver disease
- *Alcoholic-cardiomyopathy
- *Alcoholic neuropathy
- *Wernicke-Korsakoff syndrome

Risks of Delirium Tremens

Alcohol use changes excitatory and inhibitory mechanisms of activity within the nervous system resulting in a slowdown of brain functioning that a person typically experiences as sedation and decreased anxiety. With continued alcohol use, the brain compensates for the ongoing presence of alcohol by altering the interplay of these two mechanisms and, as a result, individuals will have to drink increasing the amount of alcohol.

This adaptation is referred to as tolerance. Over time, the brain continues to adapt as a person continues to drink. Eventually a person develops a dependence to alcohol, which means that when alcohol use is stopped or significantly reduced the brain is still producing excitatory signals to compensate for alcohol's inhibitory effects. This overcompensation results in greater weight on excitatory signal's and causes a state of hyper-arousal that a person experiences as withdrawal symptoms.

o

Some risk factors related to the severity of alcohol withdrawal, including the development of DTs include:

- Higher amounts of alcohol consumed in the weeks prior to withdrawal
- The number of previous episodes of alcohol withdrawal symptoms, which includes DTs or withdrawal seizures
- Underlying health issues, which can include:
 - *Major injuries
 - *Liver or heart disease
 - *Traumatic brain injury
- Being of older age
- Other medications or supplements
- Having a psychiatric disorder
- Being in poor general health, particularly lacking a well-balanced diet

People who are older or those who have additional physical health conditions are at significantly higher risk for the development of delirium tremens, it is important to seek medical care if you have these risk factors and want to stop heavy, prolonged use of alcohol. These issues can also make symptoms of delirium tremens worse and more predictable harder to manage and more dangerous to your health and safety; severe alcohol withdrawal may require treatment in an intensive care unit as opposed to typical inpatient hospitalization.

Prevention of Delirium Tremens

To prevent hazardous alcohol use, routine screening and brief intervention for high-risk alcohol use should be performed in primary care settings and in emergency departments; this may reduce alcohol consumption and adverse consequences in risk drinkers who are not alcohol dependent. Use of the AUDIT or CAGE questionnaire is helpful in screening.

Protocols for screening individuals at risks for hazardous alcohol use, followed by a brief intervention (5-10%) carried out by a:

- *Clinician
- *Nurse
- *Social worker

Have been shown to result in a reduction in alcohol consumption and alcohol-related injuries and decreased readmissions to the emergency department. Computer-based screening and counseling programs may be useful when clinicians do not have time to perform screening and face-to-face intervention.

The effectiveness of brief interventions for heavier drinkers and in the acute care setting is unknown. Chronic, severe alcohol dependence is frequently resistant to existing methods of interventions but pharmacotherapy with brief medical management counseling may reduce heavy drinking in these alcohol-dependent individuals.

Symptoms of Delirium Tremens

o

Symptoms of DTs often serve as diagnostic tools for patients and physicians, especially upon cessation of reduced alcohol intake after prolonged or heavy periods of consumption. These are symptoms to watch for if DTs are a possibility or a concern in yourself or a loved one. The onset of your delirium tremens symptoms often occurs within 1-4 days of developing acute alcohol withdrawal, according to the National Institute on Alcohol Abuse and Alcoholism (NIAAA).

These symptoms include:

- | | |
|--------------------------|--|
| *Nausea | *Vomiting |
| *Disorientation | *Increased hand tremors |
| *Insomnia | *Mood changes |
| *Nightmares | *Headaches |
| *Pain | *Lack of appetite |
| *Irritation or agitation | *Hallucinations |
| *High levels of Anxiety | *Excessive sweating |
| *Palpitations | *Tremors |
| *Upset stomach | *Elevated pulse, blood pressure and temp |

Seizures-these episodes tend to be of the tonic-clonic variety where the whole body shakes violently

Confusion-Most individuals who pass through alcohol withdrawal will experience some type of foggy thinking

Sometimes the symptoms significantly impair normal social, occupational, and overall ability to function. It is more likely to be a result of delirium tremens if there is no other general medical condition they can be attributed to. Most patients who ultimately develop DTs experience alcohol withdrawal symptoms before developing delirium tremens. Some co-occurring medical conditions may make it more difficult to diagnose and treat delirium tremens, including:

- *Altered blood chemistry
- *Some infections
- *Wernicke's Syndrome

Symptoms of delirium tremens do not just suddenly appear, but rather progress from earlier withdrawal symptoms. Symptoms may change over the course of the day, and may include:

- *Agitation, aggression, or irritability
- *Confusion

Severe autonomic hyperactivity:

- *Trembling
- *Sweating
- *Tachycardia
- *Nausea and vomiting
- *Impaired consciousness
- *Visual, tactile, or auditory hallucinations
- *Tremors or seizures

Patients receiving sufficient medical treatment and support have a much lower risk of death from delirium tremens than those who receive no medical care for their condition.

Alcohol-Related Liver Disease

Alcohol-related liver disease may be one of the most common symptoms of heavy drinking. This is because the liver is one of the main organs affected by alcohol consumption. The liver is responsible for degrading and breaking down most of the alcohol consumed in the human body, allowing to be removed from the body. However, in the process, the broken-down substances become even more harmful than alcohol to specific parts of the body, such as the liver. These substances can damage liver cells and may cause serious liver disease. In fact, alcohol is the cause of 80% of the deaths resulting from liver disease. These forms of liver disease include:

- *Fatty liver (steatosis)
- *Inflammation of the liver (hepatitis)
- *Acute alcoholic hepatitis
- *Scarring of the liver (cirrhosis)
- *Liver failure and death

Fatty Liver or Steatosis

This is the most common type of alcoholic liver disease. Fat and adipose tissue build up in the liver, making it extremely difficult for the liver to function efficiently. The fat build up prevents the liver from working properly.

Inflammation of the Liver or Hepatitis

This can also be caused by heavy alcohol consumption. About a third of individuals with a fatty liver will develop a mild to moderate inflammation of the liver. This inflamed liver is known as alcoholic hepatitis. Alcoholic hepatitis is extremely risky because symptoms usually do not surface right away. Making it more difficult for alcoholics to realize they have hepatitis. This is especially true if the patient is constantly under the influence.

Acute Alcoholic Hepatitis

This is much more serious than inflammation of the liver and can be even more life-threatening. Inflammation from acute alcoholic hepatitis can cause:

- *Loss of appetite
- *Sickness, nausea, vomiting and stomach pain
- *Jaundice (yellow appearing skin)
- *Liver failure
- *Death

Sadly, around one out of three individuals who develop severe alcoholic hepatitis will die.

Scarring of the Liver or Cirrhosis

Also common among heavy drinkers. Around 20% of alcoholics suffer from scarring of their liver. Alcohol disrupts the liver, releasing toxins that begin to cause scar tissue. Due to this degradation, excess amounts of scar tissue build up in the liver.

o

Over time, this scar tissue begins to replace normal healthy cells. This means that the liver will not work properly and has the potential to fail. Similar to hepatitis, cirrhosis may not cause symptoms right away. However, symptoms of liver cirrhosis include:

- *Feeling sickly
- *Vomiting blood
- *Swollen stomach
- *Loss of appetite
- *Itching
- *Muscle cramps

Treatment usually includes:

- *Antibiotics
- *Water pills

They are used to remove fluid build-up from the abdomen. Left untreated, alcoholic liver disease can cause liver cancer and eventually kidney failure.

Alcoholic Cardiomyopathy

In addition, alcoholic cardiomyopathy is heart failure caused by the long-term use of alcohol.

Treatment usually includes reducing sodium intake and a prescription for beta-blockers and ACE inhibitors. In more severe cases, a heart transplant may be needed if cardiomyopathy is not able to be effectively treated.

Alcoholic Neuropathy

This damage to the nerves caused by heavy drinking. Symptoms include:

- *Numbness
- *Tingling
- *Painful sensations
- *Muscle problems

Treatment usually relies on physical therapy and symptom management. This nerve damage is, more often than not, permanent.

Wernicke-Korsakoff Syndrome

Aside from the liver, alcohol also severely damages the brain. Wernicke-Korsakoff syndrome is a brain disorder closely associated with alcoholics. Intense alcohol use often results in brain damage in the thalamus and hypothalamus, areas of the brain that regulate homeostasis and memory. Those with Wernicke-Korsakoff syndrome usually experience damage to the parts of their brain involved with memory. Vitamin B-1 can alleviate symptoms that involved with memory. Vitamin B-1 can alleviate symptoms that involve muscle problems, but memory loss is often permanent.

Delirium Tremens-Diagnosis

o

How is delirium tremens diagnosed? The doctor will do a physical examination, ask about the present and previous medical history, and will discuss the symptoms he or she is under-going. Some of the symptoms that they particularly look at are:

- *Dehydration
- *Fever

The doctor will listen to the heart sounds to know if there are any signs of a rapid or irregular heartbeat.

In addition, the doctor may ask the loved ones who are the patient or the caregiver a certain set of questions from a questionnaire called a Clinical Institute Withdrawal Assessment of Alcohol Scale (CIWA-Ar). This assessment helps the doctor to determine and measure the nature and severity of the symptoms. When the score is 15 or higher, it indicates that the person is at high risk for delirium tremens.

The doctors will conduct a variety of laboratory tests which include:

Blood Tests

Blood magnesium levels and blood potassium levels are checked. When the magnesium and potassium serum levels in the blood are very low, then the heart will not have the ability to function normally. This is a sign of severe withdrawal or severe alcoholism.

Electrocardiogram (ECG)

It helps to detect the heart's electrical activity to evaluate the functioning of the heart.

MRI (Magnetic Resonance Imaging)

It helps to look for the symptoms of seizures or head injury.

Electroencephalogram (EEG)

This test affects the brain's electrical activity. Severe alcohol withdrawal results in changes in the brain, leading to seizures.

Lumbar Puncture Test

This test is utilized to examine spinal cord fluid.

- *Metabolic panel

Toxicology Screening

It measures the alcohol present in the body, which is identified with the blood or urine sample.

In addition, the doctor also checks:

- *The heart
- *The nerves in the feet
- *Liver
- *The digestive tract

o

This determines how much the alcohol has damaged the body.

Delirium Tremens-Treatment

Holy Flower helps to alleviate severe headaches that are connected to delirium tremens. These include:

*Cluster

*Migraines

These are associated with the delirium tremens “shaking frenzy”. These have all been effectively treated with Holy Flower. Holy Flower has been proven to effectively treat anxiety disorders, which helps to decrease nightmares.

Holy Flower has been proven to treat nausea and vomiting, also symptoms of chemotherapy and AIDS. Research has shown this in many recorded studies and FDA supports using synthetic medical marijuana. This can help those with delirium tremens relax, help their doctors administer medication and help them get nutrients they need to recover physically.

Holy Flower and Delirium Tremens-Beneficial Treatment Methods

There are many forms of treatment methods and Holy Flower strains for individuals to use to treat delirium tremens. Not only is Holy Flower natural without harsh side effects, but much safer without the risk of addiction, overdose or death that are associated with prescription medications. Some of the best treatment methods include:

Smoking Holy Flower

When a person thinks of marijuana, typically they associate smoking with it. When smoking Holy Flower, it provides almost instantaneous effects, which is typically the most well-known method over every other method. One concern would be the effects on an individual's respiratory system.

Vaping Holy Flower

Vaping Holy Flower is a good alternative to smoking Holy Flower. Vaping reduces the byproducts created because it uses a lower temperature. Holy Flower's chemicals, like with smoking, enters the bloodstream fairly quickly with vaping, and like smoking offers almost instant relief.

Tinctures and Oils

Tinctures and oils use Holy Flower in concentrations you can add to beverages and food, or you can simply take the oil by itself. The oil may be added to a pill or a capsule to swallow it. Tinctures and oils provide fast relief. Dosing by this method gives the patient better control and an advantage to using tinctures and oils, and especially important if it's high in CBD levels when cannabis oil is prepared and dosed properly, it is an effective treatment.

o

Edibles

Edibles are an excellent choice when it comes to treating symptoms of delirium tremens. Edibles are made from infused butter or oils. They can be made at home or purchased at a dispensary and are commercially produced. Edibles come in many forms such as:

- *Baked goods
- *Candy
- *Ice cream

Virtually all your favorite foods can be infused. Effects are felt anywhere from 10 minutes to an hour, and last anywhere from 6-8 hours, depending on the potency. The best advice I can give to anyone new to edibles is to start with a low dose and consume slowly. I personally use Sammy-Butter, which is a canna-butter which I created to treat my decade long struggle with chronic pain. I personally use Sammy-Butter in everything I cook and bake and highly recommend it to anyone who deals with their own health issues. Each Sammy-Butter strain that I have created has been designed to treat a variety of health issues.

Holy Flower has analgesic properties that relieve pain. Holy Flower also acts as a sedative, which helps to combat the symptoms of delirium tremens. Holy Flower has a very calming effect for patients who respond well to it.

How Holy Flower Assists with Alcohol Withdrawal or Delirium Tremens

The majority of the proof that Holy Flower is a workable remedy for delirium tremens is either via the practice or via its well-known ability for assisting certain signs and symptoms of delirium tremens. Several sources about utilizing Holy Flower for alcohol withdrawal or delirium tremens have displayed that the plant and its amazing benefits assist individuals throughout the withdrawal of being alcoholic.

Pieces of research from recreational clinical studies display that people can be allowed to utilize therapeutic marijuana to alleviate remarkable mental signs of alcohol withdrawal. Holy Flower is a legal choice in:

- *Treating
- *Soothing
- *Repairing the mind from vicious and aggressive illnesses and gives the most required healthy dose for sufferers.

Additionally, using Holy Flower also helps reduce serious headaches connected to alcohol withdrawal. Clump and migraines sometimes comply with the alcohol withdrawal's shaking hysteria and have been successfully tended with therapeutic Holy Flower. This also recommends that other kinds of headaches can react to Holy Flower treatment. Holy Flower is also an excellent analgesic to treat pain in many health issues such as:

- *HIV/AIDs
- *Back pain
- *Multiple sclerosis
- *Shingles
- *Cancer
- *Arthritis
- *Neuropathy

Holy Flower can lessen bad dreams in anxiety disorders such as:

o

*Post-traumatic stress disorder (PTSD)

Holy Flower is used to cure nausea and vomiting for cancer patients and those who have AIDS. The Food and Drug Administration (FDA) helped the utilization of simulated therapeutic marijuana. Every proof indicates that therapeutic marijuana relieves nausea. With that being stated, Holy Flower assists individuals who have delirium tremens loosen up, helping physicians manage treatment, and assist them to have nutrients they require to get well physically.

Furthermore, this amazing plant has pain-relieving properties and plays as a depressant, which gives the patients a natural and safer remedy to fight the signs of delirium tremens or alcohol withdrawal.

Delirium Tremens-Clinical Research

Studies from recreational clinical research show individuals might be able to use Holy Flower to ease noticeable mental symptoms of delirium tremens. Holy Flower is an approved alternative medication for calming and mending the mind from aggressive disorders and provides relief from insomnia.

Endocannabinoid System (ECS)

What is the endocannabinoid system or ECS? The endocannabinoid system (ECS) regulates skin health. The cannabinoids in Holy Flower interact with the endocannabinoid system to improve skin health. Our bodies have a large endocannabinoid system that includes specialized receptor cells in the brain and throughout the rest of our bodies, including:

- *Digestive system
- *Organs
- *Muscle
- *Skin
- *Connective tissue
- *Glands
- *Immune cells

The endocannabinoids are literally a bridge between body and mind. It is a natural Part of the body, and our bodies make endocannabinoids naturally in addition to the cannabinoids that are present in cannabis. The ECS is active and present in our daily lives whether or not we use cannabis or cannabinoids. The ECS includes the cannabinoid receptors CB1 & CB2, and they have an influence on complex body functions. Cannabinoids and endocannabinoids bind to receptors and help to regulate how our body functions. Some cannabinoids can help manage other substances from influencing the receptors and body functions. Overall, research has shown that the ECS is linked to the following processes in the body:

- *Appetite and digestion
- *Metabolism
- *Pain
- *Inflammation & immune responses
- *Reproductive system & fertility
- *Motor control
- *Memory & learning
- *Sleep
- *Cardiovascular system
- *Muscle formation
- *Bone growth and health
- *Mood
- *Stress
- *Skin & nerve function

o

The main function of the endocannabinoid system is to help our bodies maintain homeostasis, which is a biological or medical term that refers to stability and the ability to function healthily in your environment.

How Do Cannabinoid Receptors Work?

Our bodies have two main types of cannabinoid receptors:

*CB1

*CB2

It is possible there may be more types of receptors that haven't yet been discovered.

Cannabinoid receptors are influenced by cannabinoids in different ways. For example, THC binds to both CB1 and CB2 receptors and affects both the brain and the body. CBD doesn't bind to CB1 or CB2 the same way THC does. It reacts with the ECS in a more complex way that is still researched. Its effects may include a variety of potential physical and mental benefits. It is currently being studied for potential uses ranging from supporting regular sleep patterns to reducing anxiety and improving concentration.

What are the Health Benefits of Cannabinoids?

The ECS influences all our body functions including, homeostasis or balance, that cannabinoids might have almost limitless health benefits. Here is a list and brief description of the more well-known cannabinoids:

CBD

Cannabidiol (CBD) is known globally and found in thousands of different products. CBD works in the body in a complex way, and it's primarily bioactive, not psychoactive. CBD in Holy Flower may be effective for Darier's disease by blocking CB2 receptors to eliminate some allergic responses in the skin that cause flare-ups.

THC

Tetrahydrocannabinol (THC) binds to both CB1 and CB2 receptors, and it has psychoactive and physical (bioactive) effects. Its best-known effect is intoxication, or the "high" effect experienced by users, as well as appetite improvement, pain, reducing anxiety and supporting comfort.

CBGA

Cannabigerolic acid (CBGA), like CBD, doesn't tend to cause a feeling of intoxication. Some researchers call CBGA "the mother cannabinoid" because it is a precursor for some other cannabinoids. Research is ongoing to discover if it can relieve anxiety and physical discomfort, and combat inflammation and infection in humans.

THCA

o

Δ^9 -tetrahydrocannabinolic acid, THCA, is found on the living cannabis plant. The compound slowly turns into THC as the plant ages and quickly becomes THC when it is heated (smoked or vaped). Research is just starting on THCA, but it is generally known to be non-intoxicating reports show it could have benefits for inflammation and neuroprotection for degenerative neurological diseases. Early studies are being conducted to determine whether THCA could potentially:

*Reducing nausea

*Improve appetite

*Slow the spread of prostate cancer

CBDA

Cannabidiolic acid, CBDA, is another compound found in living cannabis plants. CBDA doesn't bind to CBD1 or CBD2 receptors. Instead, it inhibits enzymes that influence the ECS system.

CBCA

CBCA, Cannabichromenic acid, is a precursor to CBC, and it is also another chemical step descended from CBGA. CBC is one of the phytocannabinoids that comes from the cannabis plant. CBGA was first discovered in 1966, but research into its benefits is currently limited.

CBGVA

CBGVA, Cannabigerovarinic acid, is the precursor of CBGV or cannabigerovarin. Like the other acid precursors, it is found in the living cannabis plant or raw cannabis flower and transforms when exposed to heat. It is non-psychoactive, like most cannabinoids. However, research is very limited on this cannabinoid, so its effects are not well known.

THCVA

THCVA, Tetrahydrocannabivarinic acid, is a precursor to THCv, tetrahydrocannabivarin, and is like the other cannabinoids that come from the raw flowers of the cannabis plant. THCVA can potentially reduce inflammation. THCv has been studied more than THCVA, and some research studies show that it can have benefits in reducing overeating and obesity.

CBDVA

CBDVA, Cannabidivarinic acid, is the chemical precursor to CBDV, and both are similar to CBD (cannabidiol). Like other cannabinoids, remains under study, though it is known that CBDVA is not intoxicating.

CBCVA

CBCVA, Cannabichromenvarinic acid, is considered one of the major acids found in the cannabis plant, and like other cannabinoids found in the living plant, it isn't thought as psychoactive/intoxicating.

The National Center for Complementary and Integrative Health reports that lab-created cannabinoid drugs (approved by the FDA) can be used to manage:

*Epilepsy

*Nausea

*Vomiting

o

- *Weight loss
- *Loss of appetite

A 2017 study conducted by the National Academies of Science, Engineering and Medicine concluded that there was conclusive, substantial evidence that cannabinoids from the cannabis sativa plant could benefit:

- *Nausea and vomiting
- *Muscle spasticity

They also found moderate evidence for cannabinoids benefitting:

- *Sleep outcomes in people with obstructive sleep apnea
- *Muscle spasms
- *Potential pain relief

Further continuous research is ongoing for:

- *Increasing appetite
- *Decreasing weight
- *Improving clinician-measured MS symptoms (as opposed to patient report)

What are Cannabinoids?

Cannabinoids are natural chemical compounds found in a viscous resin produced in glandular trichomes in the cannabis plant. They interact with your body through receptors that are part of our natural endocannabinoid system.

Cannabis Sativa contains about 600 different molecules, but out of these there are about 140 classified as cannabinoids. They are the alkaloid compounds in cannabis that can influence your body's natural endocannabinoid system. There are three main classifications of cannabinoids:

Phytocannabinoids

Found in cannabis stalks, leaves, flowers, seeds, and resin

Endocannabinoids

Cannabinoids made by the body

Synthetic Cannabinoids

Lab-created cannabinoids (like prescription medications)

What do cannabinoids do? Cannabinoids bind to natural receptors (cells that react to proteins and other molecules) in our central nervous system and peripheral nervous system. The receptors are specific cells located in our brain and nearly everywhere else throughout the body. The main cannabinoid receptors are:

- *CB1
- *CB2

o

Some cannabinoids bind to CB1 receptors which are located primarily in the brain and throughout the central nervous system. The best-known cannabinoid, THC, binds with these receptors and produces the euphoric psychoactive effects people are most familiar with from using marijuana.

The second best-known cannabinoid, CBD, interacts primarily with CB2 receptors. CBD's effects are physical not psychoactive.

History of Holy Flower Use

Holy Flower dates to the beginning of time. Starting in the book of Genesis 1:12, starting, "and the earth brought forth grass, and herb yielding seed...God saw that it was good." Another bible verse from Genesis 9:3 states, "Every moving thing that lives shall be food for you. And as I give you the Green plants, I give you everything." God said it Himself, he put Holy Flower on our earth to use for our health and in many forms for our benefit.

Jesus was the very first advocate for the use of Holy Flower and to treat the sick and suffering with many health issues. In the Guardian a study of scriptural texts suggests that Jesus and his disciples used Holy Flower to carry out and perform miraculous healings. The anointing oil used by Jesus, who certainly was a cannabis user, and his disciples, contained an ingredient called Kaneh-bosem which has since been identified as cannabis extract, according to an article by Chris Bennett in the drug magazine High Times, entitled Was Jesus a Stoner? The incense used by Jesus in ceremonies also contained a cannabis extract, suggests Mr. Bennett, who quotes scholars to back his claims.

Carl Ruck, a professor of classical mythology at Boston University states, "There can be little doubt about a role for cannabis in Judaic religion." Referring to the existence of cannabis in anointing oils used in ceremonies. He added, "Obviously the easy availability and long-established tradition of cannabis in early Judaism would inevitably have included it in the (Christian) mixtures.

Another profound statement from Mr. Bennett suggests those anointed with the oils used by Jesus were "literally drenched in this potent mixture although most modern people choose to smoke or eat the Holy Flower, when its active ingredients are transferred into an oil-based carrier, it can also be absorbed through the skin."

Quoting the New Testament, Mr. Bennett argues that Jesus anointed his disciples with the oil and encouraged them to do the same with the other followers. This could have been responsible for healing eye and skin diseases referred to in the Gospels.

This powerful and truthful statement from Mr. Bennett concludes, "If cannabis was one of the main ingredients of the ancient anointing oil and receiving this oil is what made Jesus Christ and his followers Christians, then persecuting those who cannabis could be considered anti-Christ." I couldn't agree more with this statement.

o

Holy Flower has been used globally dating back for centuries throughout India, China, Africa, and Assyria. It was used for medicinal, spiritual, and recreational purposes.

Medicinal use of Holy Flower dates back at least 5,000 years, as such cannabis history is tied to many iconic time periods. Examples of this are:

-The ancient Egyptians reportedly used marijuana to treat glaucoma as well as general inflammation.

-Chinese Emperor Fu His called cannabis a popular medicine in 2900 BC, and the Chinese had identified more than 100 medical uses for Holy Flower by 100 AD.

-In 1,000 BC, the Indians created a drink called Bhang, a mixture of marijuana, milk, and other ingredients, and used it as anti-phlegmatic and anesthetic. This drink is currently used in India.

Like Jesus, ancient Indians have used Holy Flower as a cure for:

*Leprosy

*Dysentery

*Cure fever

*Insomnia

*Improve judgement & cognition

It is also thought to prolong healthy life. Other ancient cultures also used Holy Flower. The ancient Greeks used it for:

*Inflammation

*Earaches

*Swelling

In 70 AD, Roman medical texts listed it as a cure for earache and as a way to suppress sexual desire. The Romans also boiled the roots of the plant and used them as a treatment for:

*Gout

*Arthritis

*Generalized pain

The Arabians used it from 800 AD to 900 AD for:

*Migraines

*Syphilis

*Pain

The English also documented many medicinal uses of Holy Flower for ailments, such as:

*Menstrual cramps

*Convulsions

*Rheumatism

*Gout

*Joint pain

*Muscle spasms

*Insomnia and sleep problems

*Childbirth (to promote uterine contractions)

Spiritual History of Holy Flower

o

Holy Flower has a very long history spiritually. It is said the Hindu god Shiva rested under a cannabis plant and ate its leaves following a family argument. Sounds to me a great way to overcome the tension and stress of any heated situation. Shiva is referred to as the Lord of Bhang. The Vedas, a collection of ancient scriptures, refer to Holy Flower as an herb to release people from anxiety. One story in the Vedas describes a drop of heavenly nectar falling on the earth and becoming the cannabis plant.

In his Histories, Greek Historian Herodotus described cannabis being smoked for spiritual, emotional, and sometimes recreational purposes. He discussed groups coming together and smoking, stating that the people smoking marijuana would “howl with pleasure!”

Marijuana has had a long and very rocky past in the United States since this country was formed. Originally used as a textile material and later a medicinal ingredient, this awesome plant became highly controversial through the years. Below is the Holy Flower timeline in the United States:

1600s

The origins of marijuana in the United States can be related back to the earliest days of settlement when hemp was grown like any other crop. In the 17th century, the production of hemp-a variety of the cannabis plant-was highly encouraged to make:

- *Clothing
- *Rope
- *Sails

In 1619, the Virginia Assembly passed legislation requiring that all farms grow hemp. Some states even traded hemp as legal tender.

1700s

George Washington, our first United States president, was interested in farming hemp. But he also questioned the potential of marijuana in his journals in 1765.

1840

Marijuana became widely accepted in mainstream medicine and was an ingredient in many over-the-counter products.

1850

Holy Flower was added to the U.S. Pharmacopeia. It was used as a treatment for:

- *Opioid withdrawal
- *Pain
- *Appetite stimulation
- *Relief of nausea and vomiting

1862

o

Hashish candy was advertised in an issue of Vanity Fair as a pleasurable and harmless stimulant that could cure melancholy and nervousness.

1906

The Food and Drug Act required that any product containing cannabis be labeled appropriately.

1900-1930

For 3 decades, Holy Flower was an ingredient in a variety of medications. It was marketed as a painkiller but was also used for sedation and to treat muscle spasms. However, during this same time, Mexican immigrants introduced recreational use of marijuana. Because the drug became associated with Mexican Immigrants, people began to fear the drug, anti-drug campaigners who were clearly ignorant referring to it as the “Mexican Menace.”

1914-1925

Twenty-six states passed laws prohibiting marijuana. These laws passed readily and easily with little to no public outcry or political debate.

Even though this was a century ago, and research was not so readily at our ancestors' fingertips, in my opinion, the laws passing prohibiting Holy Flower with the American people in such a passive state of being and clearly not awakened to the fact of the plethora of benefits the glorious plant has which has been proven by many generations on a global scale. Instead of just going along with a person's belief in it being harmful or evil as some have said, take the time to educate yourself by truly weighing the pros and cons and reviewing factual evidence from the many documented sources available. Let's continue.

1930s

The Great Depression resulted from job loss for many Americans. This created more fear and stigmatization of Mexican immigrants as many Americans worried, they would take away their jobs. This led to more public concern over the dangers of marijuana. The media began to report that research showed that marijuana use was linked to “crime and violence”. At the same time, Harry Anslinger, commissioner of the Federal Bureau of Narcotics, began a campaign to criminalize marijuana, claiming that it led to insanity. That statement alone is insane. As a result of his efforts, by 1936, all states had some form of marijuana regulation laws.

1936

The film Reefer Madness was released. It depicted marijuana as a drug that could lead to:

- *Violence
- *Rape
- *Suicide
- *Psychosis

1937

The Marijuana Tax Act was passed which restricted marijuana use to only those that could pay a heavy excise tax for specific authorized industrial and medical uses.

o

1942

Marijuana was removed from the U.S. Pharmacopoeia and doctors began to discredit marijuana as not having any medicinal use.

1944

The New York Academy of Medicine published a report stating that marijuana was only a mild intoxicant. Harry Anslinger responded to this report with a solicited article in the American Journal of Psychiatry that attempted to attack and discredit the information they had previously published.

1952

The Boggs Act passed, creating strict mandatory punishments for offenses involving marijuana and a variety of other drugs.

1960s

Marijuana gained popularity among the counterculture who considered it a harmless high. Its use was popular among college students, free-spirited, anti-war activists, hippies, and other youth. President John F. Kennedy and Vice President Lyndon Johnson commissioned reports that found that marijuana did not induce violence or lead to use of other more dangerous drugs.

1965-1970

Marijuana arrests on the state level increased tenfold as authorities began to crack down on marijuana use and distribution.

1970

Congress passed the Controlled Substances Act, which placed marijuana as a Schedule I drug along with LSD and heroin. According to the act, marijuana had no medicinal value, and a high potential for abuse, giving it harsher criminal penalties. This law made it difficult for doctors and scientists to study marijuana and its many uses. Despite federal efforts to strengthen enforcement of strict marijuana laws, states the following all decriminalized such as:

*Oregon

*Maine

*Alaska

1972

The Shafer Committee recommended that personal use of marijuana be decriminalized. But President Nixon ignored their recommendations.

1976

The parents' movement against marijuana began, as more and more parents feared the drug and sought to prevent use in teens. Their efforts were strengthened by the Drug Enforcement Administration and the National Institute on Drug Abuse.

o

1980s-1990s

The public opinion of marijuana shifted back to it being dangerous, as many considered it a gateway drug to harder drugs such as:

*Cocaine

*Heroin

1982

First Lady Nancy Reagan started the “Just Say No” campaign.

1983

The Drug Abuse Resistance Education (DARE) program was established, which brought police officers into schools to discuss the dangers of drug abuse. Funding and use of this program was later cut back as research showed that it did not lead to decreased drug use in youth.

1986

President Ronald Reagan signed The Anti-Drug Abuse Act. This law raised marijuana penalties and created mandatory sentences many of which equated marijuana with heroin.

1989

President George H.W. Bush declared a “New War on Drugs” and continued anti-marijuana campaigns.

1996

California voters approved Proposition 215, which legalized marijuana for medicinal use at the state level.

1998-1999

The Clinton Administration spent \$25 million on television campaigns that placed drug messages in primetime TV shows.

Marijuana remains illegal under federal law in the United States, although the laws on the state level are increasingly changing more than 20 states now permit the sale of Holy Flower, either medical or medical and recreational, in various forms to inhale, consume or prescription form.

There presently two FDA approved medications on the market:

*Marinol (Dronabinol)

*Cesamet (Nabilone)

Both are synthetic cannabinoids used to treat nausea or neuropathic pain. Other drugs in clinical testing are:

*Epidelix-used to treat childhood seizures

*Sativex-for cancer pain

o

In 2014, Colorado was the first state to legalize Holy Flower recreational use. Alaska, California, and Washington followed suit. Along with Massachusetts and Washington D.C. as well as Nevada deciding recreational being legal is the only way to go.

While Holy Flower is still unfortunately illegal on the federal level, doing the scientific research for medicinal purposes has been made rather difficult as well as dispensaries running the risk of being close down by the Drug Enforcement Administration. As time progresses and the more people in general across the country are urging lawmakers to pass legalization, the more states will become legal not only for medical patients but also for recreational use.

The Bottom Line

Research contributing to Holy Flower as a remedy for delirium tremens or alcohol withdrawal remains in its untimely phases. Nonetheless, there are indications of development. When you make up your mind that Holy Flower is a substitute for your treatment seek advice from a physician who is knowledgeable about Holy Flower.

Additionally, individuals asserted that using Holy Flower to treat delirium tremens or alcohol withdrawal. Clinical research regarding this treatment is progressing. Individuals may find soothing affects to assist with anxiety and alleviating the many symptoms of withdrawal.

Holy Flower Strains by Symptom Category

Holy Flower comes in so many varieties of strains with so many effects to treat literally a plethora of health issues that every individual on the plant deals with. I have researched the best strains that fit in each category of the symptoms associated with Delirium tremens that include:

- | | |
|----------------------|-------------------|
| *Nausea & Vomiting | *Insomnia |
| *Anxiety | *Depression |
| *Seizures | *Loss of appetite |
| *Headaches/migraines | *Gastrointestinal |
| *Pain | |

On the following pages there are alphabetical lists of Holy Flower strains and their THC percentages. Each symptom category is listed separately. The strain types include:

- Indica and Indica-Dominant (I and I-D)
- Sativa and Sativa-Dominant (S and S-D)
- Hybrid (H)

Indica and Indica-Dominant

Indica and Indica-Dominant strains are best used in the evening and nighttime as the effects include:

- Body melt-effortless muscle loosening

o

- Couch lock-A willingness to stop, be still, and be in the moment
- Munchies-Expect an intense desire to eat
- Sedative-A relaxed, nudge toward sleep
- Laid Back-Cool and Collective mood (anxiety lifter)
- Excellent pain relief
- Great stress reliever

Sativa and Sativa-Dominant

Sativa and Sativa-Dominant strains are best used in the morning and the day as their effects are opposite of the Indica and Indica-Dominant strains. These effects include:

- Energetic, euphoric, and uplifting
- Spacey, cerebral, and hallucinogenic
- Stimulates your appetite
- Relieves depression
- Increases your focus and alertness
- Expands your creativity and thoughts

Hybrid strains are an even 50/50 blend of both Indica and Sativa effects. If you are new to Holy Flower, it is best to experiment with different strains to find the ones that work best for you. Not every strain from the lists will be available at every dispensary. We recommend previewing the dispensary menu or speak to a budtender to assist you on which strains are available. If you have a green thumb, you may consider buying the seeds from a reputable seed bank, such as:

1. [ILGM](#) - Best US seed bank overall (free shipping)
2. [Seedsman](#) - 4,400+ cannabis seeds
3. [Crop King Seeds](#) - 24/7 live chat and toll-free number
4. [Herbies Seeds](#) - High-THC (33%+) seeds
5. [Seed Supreme](#) - 100+ landrace and Kush strains
6. [Rocket Seeds](#) - 20+ breeders worldwide
7. [Quebec Cannabis Seeds](#) - Great seeds for short seasons
8. [Mary Jane's Garden](#) - Good high-CBD seeds
9. [Sonoma Seeds](#) - Helpful customer service
10. [Beaver Seeds](#) - High germination rate

Delirium Tremens-Current Conventional Treatments

Delirium tremens symptoms of alcohol withdrawal while continuing to drink liquor prevents delirium tremens. Healthcare professionals do not recommend to keep drinking as the high amount of alcohol it takes to prevent delirium tremens which ultimately leads to even more health issues and eventually death. Hospitals use pharmaceuticals to keep the patient calm and keep seizures and hallucinations under control. Several medications are used to treat delirium tremens, include:

Benzodiazepines

The Hospitalist reports that benzodiazepines are the most common medications used to treat alcohol withdrawal and delirium tremens in the United States, though barbiturates are also effective treatments because they are also both cross-tolerant with alcohol.

Both benzodiazepines and barbiturates, which are different classes of sedative-hypnotic medications, are cross-tolerant with alcohol and effectively treat alcohol withdrawal. Acute alcohol withdrawal in the U.S. is most often managed with benzodiazepines available, from ultra-short-acting to long-acting, as well as parenteral and oral forms. The benzodiazepines most often prescribed include:

*Diazepam

o

*Chlordiazepoxide

*Lorazepam

Diazepam

It has been used extensively due to rapid onset of action when given intravenously and long duration of action when given orally.

Chlordiazepoxide

This benzodiazepine is also widely used with similar results of diazepam.

Lorazepam

An intermediate-acting benzodiazepine that can be given orally or parenterally has been used extensively for treatment of acute alcohol withdrawal, especially in hospitalized patients as it has fewer active metabolites than other benzodiazepines. This makes it safer to use in treating patients with severe liver disease, which is especially important when treating chronic alcoholics.

The side effects of benzodiazepines include:

- | | |
|--------------------|----------------------|
| *Sedation | *Aggressive behavior |
| *Dizziness | *Loss of orientation |
| *Weakness | *Excitement |
| *Unsteadiness | *Sleep disturbances |
| *Memory impairment | *Depressed feelings |
| *Headaches | *Confusion |

Barbiturates

They have been used successfully to treat acute alcohol withdrawal syndrome in general medical inpatients with phenobarbital may be preferable to other sedative-hypnotics; with its longer half-life, patients rarely achieve a “high” as they do with other sedatives, and it is available in multiple dosage forms.

Several alternative non-sedative-hypnotic medications exist to treat acute alcohol withdrawal.

These include:

- *Beta-adrenergic blockers
- *Atenolol
- *Propranolol
- *Clonidine
- *Anticonvulsant agents
- *Carbamazepine
- *Valproate

Phenobarbital

Phenobarbital, a long-acting barbiturate, offers the added benefit of serving as an anticonvulsant when used to treat delirium tremens. It successfully treats alcohol withdrawal symptoms and has a calming, sedative effect whether administered:

- *Orally

o

- *Intramuscularly
- *Intravenously

Side effects of using barbiturates include:

- *Sedative effect
- *Dizziness
- *Nausea
- *Abdominal pain
- *Vomiting
- *Lightheadedness

The sedative effect of both classes of medication helps to suppress the central nervous system hyperactivity that delirium tremens causes. This makes them both effective for treating DTs.

Propofol

Propofol is another treatment used to treat delirium tremens, especially in patients who aren't responding adequately to treatment with benzodiazepines or barbiturates. Propofol is often used to maintain sedation for patients in the ICU units and provides rapid control of the agitation and autonomic instabilities commonly associated with delirium tremens. Propofol side effects may include:

- *Nausea
- *Urine discoloration
- *Agitation
- *Coughing
- *Muscle pain
- *Itching
- *Anxiety
- *Skin rash
- *Numbness
- *Confusion
- *Stinging or burning in the area around the IV needle
- *Blisters, swelling or other skin changes at the injection site
- *Weak or shallow breathing
- *Seizures
- *Rapid or reduced heart rate

Propofol does not require tapering off dosages or weaning though some physicians prefer to wean patient's from propofol over the course of several hours.

All of these decrease alcohol withdrawal symptoms and have been used successfully in the treatment of mild withdrawal. They are not cross-tolerant with alcohol, however and may result in progression of the withdrawal syndrome. These alternative medications are not appropriate to use as single agents in the treatment of withdrawal in a general medical setting.

Dosing Regimens

There are no standard protocols for withdrawal management in widespread use. A fixed dosing schedule is commonly used for treatment of acute withdrawal, but either fixed-schedule or symptom-triggered dosing-medication given as needed for withdrawal signs-is efficacious in the treatment of withdrawal, even in patients with medical comorbidity.

Fixed-schedule dosing is a one size fits all approach for treating alcohol withdrawal. It uses the same dose of cross-tolerant medication on a fixed schedule for all patients for 24-48 hours; the dose is then tapered if the patient is stable. Reducing the dose by 10-20% of the initial dose each day over a five-to-ten-day period provides a comfortable taper-especially in patients who initially required higher doses of medication to control the withdrawal. Fixed-schedule dosing offers less flexibility for individual patients, but it is a simple approach that can be applied in many settings.

o

Symptom-triggered therapy occurs when cross-tolerant medication is given only for symptoms of withdrawal rather than on a schedule. Patients are monitored closely and assessed regularly using a tool such as the CIWA-Ar. The dose of cross-tolerant medication prescribed is based on the severity of withdrawal symptoms as measured by the CIWA-Ar score. This approach is similar to the sliding scale of insulin dosing used to treat hyperglycemia. Symptom-triggered therapy provides individualized treatment for withdrawal without overmedicating or overdosing, but it is a complex system to carry out on a general medical unit.

Severe Withdrawal

Treat severe delirium tremens manifested by abnormal and fluctuating vital signs and/or delirium aggressively in an ICU environment with sufficiently large doses of medication to suppress the withdrawal. Use IV medications with a rapid onset of action for immediate effect. Lorazepam and diazepam have a rapid onset of action when given intravenously, although the duration of action is shorter than when given orally.

For example, give lorazepam in a dose of one to four milligrams every 10-30 minutes until the patient is calm but awake and the heart rate is below 120 beats per minute. A continuous intravenous infusion may be warranted to control withdrawal symptoms, and the rate can be titrated to the desired level of consciousness. After stabilization, the patient can be changed to an equivalent dose of a long-acting sedative-hypnotic and tapered as above.

Assessing and medicating acute withdrawal remain necessary first steps in the treatment of the disease of alcohol dependence. After acute detoxification has begun, long-term treatment of alcoholism is necessary to prevent readmission for continuing medical problems due to alcohol consumption. Refer patients who have been treated for alcohol withdrawal for long-term treatment of alcoholism. This may include Alcoholics Anonymous, outpatient counseling and other treatment modalities.

Ask all patients admitted to the hospital about drinking alcohol and be alert for signs of acute withdrawal in any patient. The best predictor of whether a patient will develop acute withdrawal. Signs of withdrawal usually occur within 48 hours of the last drink. Untreated withdrawal may result in significant morbidity and mortality.

Patients in withdrawal should be monitored closely and given appropriate doses of benzodiazepines or barbiturates to treat withdrawal signs. Cross-tolerant medication may be given on a fixed schedule or a symptom-triggered therapy. Severe withdrawal may require a continuous intravenous infusion in an ICU. Recognition and effective treatment of alcohol withdrawal can prevent significant complications in hospitalized patients.

Other conventional medications that are prescribed to treat delirium tremens include:

- *Valium
- *Ativan
- *Librium
- *Serax

Some side effects of the above drugs include:

o

- *Memory and judgement impairment
- *Slow breathing
- *Sleepiness
- *Muscle weakness
- *Lack of coordination

Recent Developments of Conventional Treatment of Delirium Tremens

While benzodiazepines represent the first-line medications of choice for the treatment of delirium tremens, increasing evidence suggests non-benzodiazepine anticonvulsants (NBACs) offer promising options for patients dependent on alcohol. NBACs most studied for this purpose include:

- *Valproic acid
- *Gabapentin
- *Carbamazepine

With the latter two showing the most compelling research for treating alcohol withdrawal syndrome. Researchers are also studying the usefulness of baclofen and topiramate for alcohol withdrawal syndrome.
