

Dysthymic Disorder

Dysthymic disorder pronounced 'dis-THIE-me-uh' also known as dysthymia and persistent depressive disorder is a continuous long-term (chronic) form of depression. This condition can develop during childhood, and doctors can misdiagnose it. The term "dysthymia" has Greek origins of:

- *dys-meaning bad or ill
- *thymia-meaning emotions or mind

Together, dysthymia is a mild and chronic form of depression characterized by a low mood. You may:

- *Lose interest in normal daily activities
- *Feel hopeless
- *Lack productivity
- *Low self-esteem
- *An overall feeling of inadequacy

It is not severe enough to meet the guidelines for major depressive disorder (MDD), but dysthymia tends to last longer than MDD. Technically, MDD and PDD are two separate conditions, but overlaps occur. Feelings may last for years. Dysthymic disorder may significantly interfere with you:

- *Relationships
- *School
- *Work
- *Daily activities

If you suffer with dysthymic disorder, you may find it hard to be upbeat, happy, or even celebratory on special occasions. You may even be described by those who know you as:

- *A Debbie Downer or Negative Nancy
- *Having a gloomy personality
- *Constantly complaining
- *Incapable of having fun

Individuals with dysthymic disorder can have transient periods where they are in a normal mood. Typically, individuals with dysthymic disorder tend to have lower spirits compared to a good mood and high vibes. Currently there are no laboratory tests to help determine the diagnosis of dysthymic disorder, so it is left to the mental health professional to diagnose the patient.

Unlike major or clinical depression, dysthymic disorder doesn't have a significant impact on:

- *Mental
- *Motor
- *Psychic abilities

It can significantly impact your:

- *Physical
- *Psychological well-being
- *Limitations of some functions

Individuals with dysthymic disorder can perform day to day activities even though they may not feel quite right on an emotional or mental level.

Dysthymic Disorder Statistics

The research community has collected quite a few statistics surrounding dysthymic disorder. These include:

- Doctors estimate up to 6% of the U.S. population is afflicted by dysthymia
- Dysthymia affects around 11% of teenagers ages 13-18
- About one in five adults over 18 experience dysthymia at least once in their life
- Women experience dysthymia more than men
- About 5% of the U.S. adult population has a dysthymic disorder in any given year, according to the Anxiety and Depression Association of America
- Up to 36% of outpatients in mental health settings have dysthymia, according to a study published in the Journal of Affective Disorders
- A 10-year follow-up study found 74% of people with dysthymia showed recovery from the disorder, but a 71% relapse rate.
- A 23-month observation revealed a more than 45% relapse rate
- Only 61% of adults with a major depressive disorder receive treatment

History of Dysthymic Disorder

In the Journal of Affective Disorders, the historic roots of dysthymic and cyclothymic disorders- part of the sub affective spectrum are essentially Greek, but the first use of the word 'dysthymia' in psychiatry was by C.F. Flemming in 1844. E. Hecker introduced the term 'cyclothymia' in 1877. K.L. Kahlbaum (1882) further developed the concepts of:

- *Hyperthymia
- *Cyclothymia
- *Dysthymia

With possible subthreshold symptomatology -in 1882. After Kraepelin's rubric of 'manic-depressive insanity', the term 'dysthymia' was widely forgotten, and 'cyclothymia' became ill defined. Nowadays the latter term is used in three, partially contradictory, senses: (1) a synonym for bipolar disorder (K. Schneider), (2) a temperament (E. Kretschmer) and (3) a subaffective disorder (DSM-IV, ICD-10). A renaissance of subaffective disorders began with the development of DSM-III. Therapeutically important research has focused on dysthymic disorder and its relationship to major depressive disorder, while cyclothymic disorder is relatively neglected; nonetheless, operationalized as a subaffective dimension or temperament, cyclothymia appears to be a likely precursor or ingredient of the construct of bipolar II disorder.

Types of Dysthmic Disorder (Depression)

Dysthmic disorder is a mild case of depression that comes in many forms. Without treatment dysthmic disorder can worsen into other types of depression such as major depressive disorder. Other forms of depression related to dysthmic disorder include the following:

- *Major depressive disorder
- *Premenstrual dysphoric disorder
- *Postpartum depression
- *Seasonal affective disorder

Major Depressive Disorder (MDD)

Refers to symptoms that co-occur for at least two weeks and cause significant distress or impairment in functioning, such as:

- *Interfering with work
- *School
- *Relationships

Core symptoms include:

- *Feeling down
- *Depressed
- *Experiencing anhedonia or loss of interest or pleasure in things that one typically enjoys

According to the DSM-5 (APA, 2013) the criteria for an MDE require five or more of the following nine symptoms, including one or both of the first two symptoms, for most of the day:

- *Depressed mood
- *Diminished interest or pleasure in almost all activities
- *Significant weight loss or gain or an increase or decrease in appetite
- *Insomnia or hypersomnia
- *Psychomotor agitation or retardation
- *Fatigue or loss of energy
- *Feeling worthless or excessive or inappropriate guilt
- *Diminished ability to concentrate or indecisiveness
- *Recurrent thoughts of:
 - *Death
 - *Suicidal ideation
 - *Suicide attempts

These symptoms cannot be caused by physiological effects of a substance or a general medical (e.g., hypothyroidism)

Premenstrual Dysphoric Disorder

Premenstrual dysphoric disorder (PMDD) is a health issue that is similar to premenstrual syndrome (pms) but is more serious. PMDD causes severe irritability, depression, or anxiety in the week or two before your period starts. Symptoms usually go away two or three days after your period starts. You may need medicine or other treatment to help with your symptoms. Symptoms of PMDD include:

- *Lasting irritability or anger that may affect other people
- *Feelings of sadness or despair, or even thoughts of suicide
- *Feelings of tension or anxiety
- *Panic attacks
- *Mood swings or crying often
- *Lack of interest in daily activities and relationships
- *Trouble thinking or focusing
- *Tiredness or low energy
- *Food cravings or binge eating
- *Trouble sleeping
- *Feeling out of control
- *Physical symptoms such as:
 - *Cramps
 - *Bloating
 - *Breast tenderness
 - *Headaches
 - *Joint and muscle pain

Seasonal Affective Disorder (SAD)

Seasonal affective disorder, or (SAD) is a type of recurrent major depressive disorder in which episodes of depression occur during the same season each year. This condition is sometimes called the “winter blues”, because the most common seasonal pattern is for depressive episodes to appear in the fall or winter and remit in the spring. Less commonly, SAD can occur as summer depression, typically beginning in the late spring or early summer and remitting in the fall. SAD may be related to changes in the amount of daylight a person receives.

Symptoms of SAD are not the same for everyone, but according to the DSM-5, symptoms commonly associated with the winter blues include the following:

- *Feelings of hopelessness and sadness
- *Thoughts of suicide
- *Hypersomnia or a tendency to oversleep
- *A change in appetite, especially a craving for sweet or starchy foods
- *Weight gain
- *A heavy feeling in the arms or legs
- *A drop in energy level
- *Decreased physical activity
- *Fatigue
- *Difficulty concentrating
- *Irritability
- *Increased sensitivity to social rejection
- *Avoid social situations

Symptoms of summer SAD are:

- *Poor appetite
- *Weight loss

- *Insomnia
- *Agitation and anxiety

Symptoms of SAD tend to recur at about the same time every year. To be diagnosed with SAD, the changes in mood should not be a direct result of obvious seasonal stressors (such as being regularly unemployed during the winter). Usually, this form of depression is mild to moderate. However, some individuals experience severe symptoms that leave them unable to function in their daily lives.

The Causes of Dysthymic Disorder

The exact cause for any form of dysthymic disorder is not known, but there are several causation factors related to it. Mental health professionals think it is a result of chemical imbalances in the brain. Biological changes and brain chemistry are likely to play a role in the development of a dysthymic disorder. There is also a genetic component to depression. Traumatic life events, such as, the death of a loved one can also trigger dysthymic disorder, as can having anxiety. Individuals who have a substance abuse issue can develop the disorder. Dysthymic disorder seems to run in the family, although more research is required to determine that genes are linked to it. Similar to major depression there may be more than one cause, such as:

- *Environmental
- *Biological
- *Chronic stress
- *Psychological
- *Genetic factors
- *Trauma

Biological Differences

People with dysthymic disorder may have physical changes in their brains. The significance of these changes is still uncertain, but they may eventually help pinpoint causes.

Brain Chemistry

Neurotransmitters are naturally occurring brain chemicals that likely play a role in depression. Recent research indicates that changes in the function and effect of these neurotransmitters and how they interact with neurocircuits involved in maintaining mood stability may play a significant role in depression and its treatment.

Inherited Traits

Persistent depressive disorder appears to be more common in people whose blood relatives also have the condition. Researchers are trying to find genes that may be involved in causing depression.

Life Events

As with major depression, traumatic events such as:

- *Loss of a loved one
- *Financial Issues
- *High level stress

All of these instances can trigger dysthymic disorder in some individuals.

The Effects of Dysthymic Disorder

Dysthymic disorder is a relation to major depressive disorder, the two are considered linked biologically. There are minor differences in terms of length and severity of the illness. They may also share other factors such as the following:

- The have a similar sex ratio for 2 to 1 (women to men)
- Dysthymic disorder is more common genetically among close relatives who suffer from major depressive disorder than those in the general population.
- Around 10% of dysthymic disorder sufferers may develop major depressive disorder
- Certain sleep abnormalities in both sufferers of dysthymic disorder and major depressive disorder are present
- Dysthymic disorder and major depressive disorder have similarities in affective methods of treatments
- The endocrine glands and pituitary gland, which is responsible for the controlling of stress and emotion to environmental factors and the adrenal glands influences the body's response to stress.
- A predisposition to dysthymic disorder

Diagnosis does not typically occur immediately as most individuals feel their low mood to be a character trait and neglect telling their physician. Dysthymic disorder may also occur with other mental disorders and get masked by more severe symptoms of other disorders.

If an individual with dysthymic disorder does not receive treatment, it may go on for years with the increase of developing a more serious form of depression, especially with major stressful events. On its own, dysthymic disorder can also affect many areas of your life and lead to:

- *Difficulty sleeping
- *Trouble concentrating
- *Appetite problems
- *Apathy
- *Lack of motivation

It can make it difficult to maintain:

- *Your job
- *Relationships
- *Overall health

Psychological Effects of Dysthymic Disorder

The psychological effects of a dysthymic disorder sufferer could develop a false mindset in their cognitive and perceptive view of their world around them. The sufferer could question their:

- *Intelligence
- *Their memories

- *Unstable emotions
- *Behaviors

The sufferer's ability to use the coping skills they had learned as a child is more difficult to use as the skills have been distorted due to their mental illness. The sufferer's beliefs and values are irrelevant to the person as they may feel that their views are not socially acceptable; so, they are confused as to what their real beliefs and values are. The sufferer's motivation is weakened, preventing the sufferer from doing things they once enjoyed. The sufferer's conditioning processes change from positivity to negativity and punishment.

Social Effects of Dysthymic Disorder

The sociological effects to a person with dysthymic disorder vary as each person's social life is different and their support networks:

- *Family
- *Friends
- *Medical professionals

They are the key to their successful management to their mental health illness. Other factors could be:

- *Environmental, such as:
 - *Weather
 - *Social context
 - *Cultural
 - *Economical
 - *Work
 - *School
 - *Home
 - *Religious
 - *Lifestyles

For a person to manage dysthymic disorder successfully, they need to acknowledge that:

- *Biological
- *Psychological
- *Sociological

Effects to their mental illness are intertwined together and treating the symptoms must be done as if it is only one.

Complications of Dysthymic Disorder

Complications that may be linked with dysthymic disorder, include:

- *Reduced quality of life
- *Major depression, anxiety disorders and other mood disorders
- *Substance abuse

- *Relationship difficulties and family conflicts
- *School/work issues and decreased productivity
- *Chronic pain and general medical illnesses
- *Suicidal thoughts or behavior
- *Personality disorders or other mental health disorders

Risk Factors of Dysthymic Disorder

Dysthymic disorder often begins early-during childhood, teen years, or young adult life.

Dysthymic disorder is a chronic disorder. Certain factors appear to increase the risk of developing or triggering dysthymic disorder, including:

- Having a first-degree relative with major depressive disorder or other depressive disorders, displaying symptoms of dysthymic disorder
- Traumatic or stressful life events, such as:
 - *Accident
 - *Hurricanes
 - *The loss of a loved one
 - *Financial issues or job loss
- Personality traits that include negativity, such as:
 - *Low self-esteem or loss of confidence
 - *Being too dependent or relying too heavily on others when making major decisions
 - *Self-critical
 - *Pessimistic
- History of other mental health disorders, such as a personality disorder.

Prevention of Dysthymic Disorder

There is no specific way to prevent dysthymic disorder. This disorder primarily begins during the childhood or teenage years. Identifying children at risk of Dysthymic Disorder, may assist in receiving treatment early on. Taking certain steps may assist in preventing and avoiding symptoms that include the following:

Minimize and Control Stress

This will help increase your resilience and to boost your self-esteem.

Connect with Family and Friends

Reaching out and connecting with trusted family and friends especially during times of crisis, will help during difficult times.

Receive Treatment for Early Onset of Symptoms

This step is crucial to help prevent symptoms from worsening and gain control over the disorder.

Long-Term Maintenance Treatment

Long-term maintenance treatment will help to prevent a relapse of symptoms.

Symptoms of Dysthymic Disorder

Dysthymic disorder (PDD) symptoms come and go over a period of years with severity of depression alters over time. Dysthymic disorder is a mild and chronic form of depression that may cause you to lose desire in activities you were interested in while feeling. Typically, symptoms don't disappear for more than two months at a time. In addition, major depression episodes may occur before or during persistent depressive disorder, known as double depression. Dysthymic disorder occurs with at least two of the following symptoms:

- *Hopelessness
- *Low self-esteem
- *Fatigue
- *Insomnia or hypersomnia
- *Overeating or low appetite
- *Difficulty concentrating

Symptoms of dysthymic disorder can cause significant impairment and may include:

- *Loss of interest in daily activities
- *Sadness, emptiness or feeling down
- *Hopelessness
- *Tiredness and lack of energy
- *Low self-esteem, self-criticism or feeling incapable
- *Trouble concentrating as well as trouble with decision making
- *Irritability or excessive anger
- *Decreased activity, effectiveness, and productivity
- *Avoidance of social activities
- *Feelings of guilt and worries over the past
- *Poor appetite or overeating
- *Sleep problems

In children, symptoms of persistent depressive disorder may include depressed mood and irritability. Dysthymic disorder is not as severe as major depression although your mood ranges from mild to severe. Individuals in your life may describe you as:

- *Gloomy *Moody *Irritable
- *Constant complaining *Incapable of having a good time

Symptoms of dysthymic disorder as well as intensity varies over time. Individuals with dysthymic disorder are at risk of relapse and experiencing other life problems, such as:

- *Marital
- *Financial
- *Career-related issues and setbacks

They are also at risk for developing double depression, which occurs when you already have dysthymic disorder and experience a major depressive episode concurrently.

When to see the Your Physician

When your feelings have gone on for such a long time, you may think they will always be part of your life. But if you have any symptoms of dysthymic disorder, it is recommended that you seek medical assistance. A doctor will diagnose with dysthymic disorder if:

- *The patient is feeling low or a depressed mood that persistently lasts two years-in adults
- *For children and teenagers for one year
- *Lasting most of the day
- *Occurs on most days

Talk to your physician about your symptoms. If you are reluctant in seeking assistance with a mental health professional, reach out to someone you trust to help guide you in receiving treatment, whether it is:

- *A loved one
- *A friend
- *A spiritual leader
- *A teacher
- *A trusted associate

****It is most important if you are in fear of hurting yourself or considering suicide, please do not hesitate to call 911 or emergency services immediately****

Preparing For Your Appointment

It is recommended to schedule an appointment with your physician to talk about your concerns, symptoms you or your loved one are experiencing or you may decide to see a mental health specialist, such as:

- *Therapist
- *Psychologist
- *Psychiatrist

Preparation for your appointment by journaling a list of important information that includes:

-Any symptoms you or your loved one is experiencing, including any that may seem unrelated to the reason for which you scheduled the appointment.

-Key personal information that include:

- *Any major stresses
- *Recent life changes

-Current medications that include:

- *Prescription medications
- *Vitamins
- *Herbal supplements
- *Dosing

- *Length of time taking medications
- *Prescribing physician

It may be helpful to bring a trusted family member or friend with to the appointment to help remember the information discussed in the event you forget after the appointment. It is also best to make a list of questions to ask your physician that include:

- Why can't I get over this depression on my own?
- How do you treat this type of depression?
- Will talk therapy (psychotherapy) help?
- Are there medications that might help?
- How long will I need to take medication?
- What are some of the side effects of the medication you are recommending?
- How often will we meet?
- How long will treatment take?
- What can I do to help myself?
- Are there any brochures or other printed materials that I can have?
- What websites do you recommend?

Include any other questions you can think of and have. The more you know about your own health issue, the better informed you are to have better health and quality of life.

What to Expect From Your Physician

Your physician in turn may ask you the following questions:

- When did you first notice symptoms?
- How is your daily life affected by your symptoms?
- What other treatment have you had?
- What things have you tried on your own to feel better?
- What things make you feel better?
- Have any relatives had any type of depression or another mental illness?
- What do you hope to gain from treatment?

Diagnosis of Dysthymic Disorder

If your physician suspects you have dysthymic disorder, exams and tests may include the following:

Physical Examination

Your physician may do a physical exam and ask more in-depth questions about your health to determine what may be causing your depression. In some cases, it may be linked to an underlying physical health problem.

Lab Tests

Your Physician may order lab tests to rule out other medical conditions that may cause depressive symptoms. For example, your physician may order a blood test to find out if your thyroid is underactive (hypothyroidism).

Psychological Evaluation

A psychological evaluation includes discussing:

- *Your thoughts
- *Feelings
- *Behavioral traits

A questionnaire to help pinpoint a diagnosis, is an evaluation that can help determine if you have dysthymic disorder or another condition that can affect mood, such as:

- *Major depression
- *Bipolar disorder
- *Seasonal affective disorder (SAD)

The following is a test to determine if you have dysthymic disorder.

Instructions: Please read the statements listed below. Answer each item that you believe accurately describes your condition in the last 2 years.

*Male *Female *Age _____

1. I am gloomy and sullen:

- *Never *Sometimes
- *Often *I've always been this way

2. I have poor appetite:

- *No, I always enjoy my meals
- *No, most of the time I enjoy my meals
- *Yes, sometimes I feel like the foods have lost their appeal to me
- *Yes, most of the time I eat just to consume food without enjoying it at all

3. I have difficulty falling or staying asleep:

- *Not at all, I always sleep well and feel refreshed in the mornings
- *Sometimes I have difficulties sleeping
- *I often have difficulties sleeping
- *I continuously have difficulties falling or staying asleep

4. Despite sleeping a lot of nights, I feel sleepy during the daytime:

- *Not at all *Sometimes
- *Often *Always

5. I can easily get fatigued

- *Not at all *Sometimes
- *Often *Always

6. I get the feeling that I am a worthless person:
*Never *Sometimes
*Often *Always, it is the way I perceive myself
7. I have difficulties focusing on tasks:
*Not at all *Sometimes
*Often *Always
8. It is hard for me to make any decisions:
*Never *Sometimes
*Often *Always
9. I feel like nothing will change for the better:
*Never *Sometimes
*Good part of the time *A great deal of the time
*Always

For a diagnosis of dysthymic disorder, the main indication for an adult differs somewhat from that of a child:

For an Adult

Depressed mood occurs most of the day for two or more years

For a Child

Depressed mood or irritability occurs most of the day for at least one year

Symptoms caused by dysthymic disorder can vary from individual to individual. When dysthymic disorder starts before age 21, it is called early onset. After the age of 21, it is called late onset.

Treatment of Dysthymic Disorder

Treatment for dysthymic disorder consists of medication, which either includes traditional prescription medications that come with a wide variety of side effects or Holy Flower which is natural, safer, involving a plethora of strains that treat all the symptoms of dysthymic disorder. Talk therapy or psychotherapy is also beneficial for patients dealing with dysthymic disorder.

The treatment approaches your physician recommends depends on factors such as:

- *Severity of your symptoms
- *Your desire to address emotional or situational issues affecting your life
- *Your personal preferences
- *Previous treatment methods
- *Your ability to tolerate medications
- *Other emotional problems you may have

Psychotherapy may be the first recommendation for children and adolescents with dysthymic disorder, but that depends on the individual.

Holy Flower and Dysthymic Disorder

Evidence shows Holy Flower helps with psychiatric conditions, primarily:

- *Bipolar disorder
- *Depression

Some individuals refer to this amazing plant as “Green Prozac”. Harvard School of Medicine’s emeritus professor of psychiatry, Lester Grinspoon, believes marijuana has huge potential in treating mental illness. But, like all medication it may not work for everyone.

Certain studies conducted on young adult and recreational users showed variable results. Some showed a negative link between cannabis use and depression or anxiety, while others showed a positive link. Some showed no link at all. Because of the result’s diverse pattern, researchers believe there are other factors coming into play with cannabis use to affect depression and anxiety. Also, much of the research is contradictory and none is conclusive.

Researchers observed the simple relations between cannabis use and symptoms of depression differed from those of more complicated models. Essentially, when cannabis use was the only thing under consideration, there was a positive link. However, the models that included other factors, like multiple temperament and personality factors, along with baseline depression or anxiety, showed a more negative link.

Side Effects/Symptoms of Dysthymic Disorder Holy Flower Treats

Holy Flower and dysthymic disorder can help treat a variety of related symptoms, including:

- *Low appetite
- *Low energy or fatigue
- *Depression
- *Anxiety
- *Poor focus and concentration
- *Trouble sleeping
- *Sadness
- *Weight gain or loss
- *Loss of enjoyment or interest in things once found pleasurable
- *Feelings of hopelessness

Once doctors evaluate depression symptoms, like with dysthymic disorder, they often prescribe medication, many of which are antidepressants. Individuals find the side effects of many antidepressants to be quite unpleasant, or even harmful and lead to addiction, overdose, and death. In some cases, they are worse than the depression symptoms. Some of these unwanted side effects of antidepressants include:

- *Weight loss
- *Loss of appetite

- *Nervousness
- *Nausea
- *Insomnia
- *Fatigue
- *A headache

Holy flower for dysthymic disorder offers amazing benefits and is much safer compared to prescription medications. Not only does Holy Flower treat the symptoms of dysthymic disorder, but it also helps with your entire mind, body, soul, and spirit. Your overall health will greatly improve which will motivate you to have a better quality of life. If you are new to Holy Flower it is best to try multiple strains and treatment methods to find the ones that work best for you.

Parts of the Holy Flower Plant

The following are the parts of the Holy Flower plant, including a brief description of each part:

Seeds

Seeds are produced in the female cannabis plants and carry the genetics of a male and female. Seeds need to germinate to sprout and will grow a taproot, which will become the main root that anchors the plant.

Cotyledon Leaves

These are the first leaves to grow from the seed after germination. They usually come in pairs and seeing them is a sign of successful germination and that your plant is on its way to growing healthy and strong.

Roots

The roots grow down from the main stalk of the plant into the soil. When growing from a seed, the main root is called the “taproot”. Roots are the lifelines of a cannabis plant, pulling water and oxygen into the plant so it can grow healthy and strong. Mycorrhizae, a beneficial fungus, can be added to soil to improve root system.

Stem

The main stem, or stalk, of the Holy Flower plant grows straight up from the root system and supports all lateral branches. The stem gives a plant structure and stability. Often growers will top, or cut off, the stem after about five nodes, which forces the plant to grow laterally more, creating more bud sites.

Branches

Branches grow out of the main stem and support fan leaves and buds. Growers often train a cannabis plant by topping branches to create more bud sites.

Node

A node is a point at which a branch grows off the main stem, or one branch from another branch. Fan leaves and buds can grow on some nodes, but not necessarily all. When determining the sex of a cannabis plant, pre-flowers, or the beginnings of male and female sex organs, will appear at the nodes. The space between nodes is called “internodal spacing” and will give you a sense of whether a plant will grow tall or short.

Fan Leaves

Fan leaves are the large, iconic leaves of the cannabis plant. They capture light for the plant and typically have little-to-no resin and usually discarded when trimming.

Sugar Leaves

Sugar leaves are the small, resin-coated leaves that buds form around. Sugar leaves are usually saved as “trim” during harvest and can be used for pre-rolls, extracts, and other cannabis products.

Flowers

Also known as “Buds”, the flowers of a cannabis plant are the fruits of your labor. They contain the cannabinoids and terpenes and that get you high or offer.

Cola

A cola, also called a “bud site” refers to a cluster of buds that grow tightly together. While smaller colas occur along the budding sites of lower branches, the main cola-sometimes opical bud-forms at the top of the plant.

Bract and Calyx

Abstract is what encapsulates the female’s reproductive parts. They appear as green tear-shaped “leaves” and are heavily covered in resin glands which produce the highest concentration of cannabinoids of all plant parts. Enclosed by these bracts and imperceptible to the naked eyes, the calyx refers to a translucent layer over the ovule at the flower’s base.

Stigma and Pistil

The pistil contains the reproductive parts of a flower, and the vibrant hair-like strands of the pistil are called stigmas. Stigmas serve to collect pollen from males. The stigmas of the pistil begin with a white coloration and progressively darken to yellow, orange, red, or brown over the course of the plant’s maturation. They play an important role in reproduction, but stigmas bring very little to the flower’s potency and taste.

Trichomes

Despite their minute size, it is hard to miss the blanket of crystal resin on a cannabis bud. This resin is secreted through translucent, mushroom-shaped glands on the leaves, stems, and calyxes.

Plants originally developed trichomes to protect against predators and the elements. These clear bulbous globes ooze aromatic oils called terpenes as well as therapeutic cannabinoids like THC

and CBD. The basis of hash production depends on the trichomes and their potent sugar-like resin.

What are Cannabinoids?

Cannabinoids are natural chemical compounds found in a viscous resin produced in glandular trichomes in the cannabis plant. They interact with your body through receptors that are part of our natural endocannabinoid system.

Cannabis Sativa contains about 600 different molecules, but out of these there are about 140 classified as cannabinoids. They are the alkaloid compounds in cannabis that can influence your body's natural endocannabinoid system. There are three main classifications of cannabinoids:

Phytocannabinoids

Found in cannabis stalks, leaves, flowers, seeds, and resin

Endocannabinoids

Cannabinoids made by the body

Synthetic Cannabinoids

Lab-created cannabinoids (like prescription medications)

What do cannabinoids do? Cannabinoids bind to natural receptors (cells that react to proteins and other molecules) in our central nervous system and peripheral nervous system. The receptors are specific cells located in our brain and nearly everywhere else throughout the body. The main cannabinoid receptors are:

*CB1

*CB2

Some cannabinoids bind to CB1 receptors which are located primarily in the brain and throughout the central nervous system. The best-known cannabinoid, THC, binds with these receptors and produces the euphoric psychoactive effects people are most familiar with from using marijuana.

The second best-known cannabinoid, CBD, interacts primarily with CB2 receptors. CBD's effects are physical not psychoactive.

Endocannabinoid System (ECS)

What is the endocannabinoid system or ECS? The endocannabinoid system (ECS) regulates skin health. The cannabinoids in Holy Flower interact with the endocannabinoid system to improve skin health. Our bodies have a large endocannabinoid system that includes specialized receptor cells in the brain and throughout the rest of our bodies, including:

- *Digestive system
- *Organs
- *Muscle
- *Skin
- *Connective tissue
- *Glands
- *Immune cells

The endocannabinoids are literally a bridge between body and mind. It is a natural Part of the body, and our bodies make endocannabinoids naturally in addition to the cannabinoids that are present in cannabis. The ECS is active and present in our daily lives whether or not we use cannabis or cannabinoids. The ECS includes the cannabinoid receptors CBI & CB2, and they have an influence on complex body functions. Cannabinoids and endocannabinoids bind to receptors and help to regulate how our body functions. Some cannabinoids can help manage other substances from influencing the receptors and body functions. Overall, research has shown that the ECS is linked to the following processes in the body:

- *Appetite and digestion
- *Metabolism
- *Pain
- *Inflammation & immune responses
- *Reproductive system & fertility
- *Motor control
- *Memory & learning
- *Sleep
- *Cardiovascular system
- *Muscle formation
- *Bone growth and health
- *Mood
- *Stress
- *Skin & nerve function

The main function of the endocannabinoid system is to help our bodies maintain homeostasis, which is a biological or medical term that refers to stability and the ability to function healthily in your environment.

How Do Cannabinoid Receptors Work?

Our bodies have two main types of cannabinoid receptors:

- *CBI
- *CB2

It is possible there may be more types of receptors that haven't yet been discovered. Cannabinoid receptors are influenced by cannabinoids in different ways. For example, THC binds to both CBI and CB2 receptors and affects both the brain and the body. CBD doesn't bind to CBI or CB2 the same way THC does. It reacts with the ECS in a more complex way that is still researched. Its effects may include a variety of potential physical and mental benefits. It is currently being studied for potential uses ranging from supporting regular sleep patterns to reducing anxiety and improving concentration.

What are the Health Benefits of Cannabinoids?

The ECS influences all our body functions including, homeostasis or balance, that cannabinoids might have almost limitless health benefits. Here is a list and brief description of the more well-known cannabinoids:

CBD

Cannabidiol (CBD) is known globally and found in thousands of different products. CBD works in the body in a complex way, and it's primarily bioactive, not psychoactive. CBD in Holy Flower may be effective for Darier's disease by blocking CB2 receptors to eliminate some allergic responses in the skin that cause flare-ups.

THC

Tetrahydrocannabinol (THC) binds to both CB1 and CB2 receptors, and it has psychoactive and physical (bioactive) effects. Its best-known effect is intoxication, or the "high" effect experienced by users, as well as appetite improvement, pain, reducing anxiety and supporting comfort.

CBGA

Cannabigerolic acid (CBGA), like CBD, doesn't tend to cause a feeling of intoxication. Some researchers call CBGA "the mother cannabinoid" because it is a precursor for some other cannabinoids. Research is ongoing to discover if it can relieve anxiety and physical discomfort, and combat inflammation and infection in humans.

THCA

Δ^9 -tetrahydrocannabinolic acid, THCA, is found on the living cannabis plant. The compound slowly turns into THC as the plant ages and quickly becomes THC when it is heated (smoked or vaped). Research is just starting on THCA, but it is generally known to be non-intoxicating. Reports show it could have benefits for inflammation and neuroprotection for degenerative neurological diseases. Early studies are being conducted to determine whether THCA could potentially:

- *Reducing nausea
- *Improve appetite
- *Slow the spread of prostate cancer

CBDA

Cannabidiolic acid, CBDA, is another compound found in living cannabis plants. CBDA doesn't bind to CB1 or CB2 receptors. Instead, it inhibits enzymes that influence the ECS system.

CBCA

CBCA, Cannabichromenic acid, is a precursor to CBC, and it is also another chemical step descended from CBGA. CBC is one of the phytocannabinoids that comes from the cannabis plant. CBGA was first discovered in 1966, but research into its benefits is currently limited.

CBGVA

CBGVA, Cannabigerovaric acid, is the precursor of CBGV or cannabigerovarin. Like the other acid precursors, it is found in the living cannabis plant or raw cannabis flower and transforms when exposed to heat. It is non-psychoactive, like most cannabinoids. However, research is very limited on this cannabinoid, so its effects are not well known.

THCVA

THCVA, Tetrahydrocannabivarinic acid, is a precursor to THCv, tetrahydrocannabivarin, and is like the other cannabinoids that come from the raw flowers of the cannabis plant. THCVA can potentially reduce inflammation. THCv has been studied more than THCVA, and some research studies show that it can have benefits in reducing overeating and obesity.

CBDVA

CBDVA, Cannabidivarinic acid, is the chemical precursor to CBDV, and both are similar to CBD (cannabidiol). Like other cannabinoids, remains under study, though it is known that CBDVA is not intoxicating.

CBCVA

CBCVA, Cannabichromenvarinic acid, is considered one of the major acids found in the cannabis plant, and like other cannabinoids found in the living plant, it isn't thought as psychoactive/intoxicating.

The National Center for Complementary and Integrative Health reports that lab-created cannabinoid drugs (approved by the FDA) can be used to manage:

- *Epilepsy
- *Nausea
- *Vomiting
- *Weight loss
- *Loss of appetite

A 2017 study conducted by the National Academies of Science, Engineering and Medicine concluded that there was conclusive, substantial evidence that cannabinoids from the cannabis sativa plant could benefit:

- *Nausea and vomiting
- *Muscle spasticity

They also found moderate evidence for cannabinoids benefitting:

- *Sleep outcomes in people with obstructive sleep apnea
- *Muscle spasms
- *Potential pain relief

Further continuous research is ongoing for:

- *Increasing appetite
- *Decreasing weight
- *Improving clinician-measured MS symptoms (as opposed to patient reports)

History of Holy Flower Use

Holy Flower dates to the beginning of time. Starting in the book of Genesis 1:12, starting, "and the earth brought forth grass, and herb yielding seed...God saw that it was good." Another bible verse from Genesis 9:3 states, "Every moving thing that lives shall be food for you. And as I give you the Green plants, I give you everything." God said it Himself, he put Holy Flower on our earth to use for our health and in many forms for our benefit.

Jesus was the very first advocate for the use of Holy Flower and to treat the sick and suffering with many health issues. In the Guardian a study of scriptural texts suggests that Jesus and his disciples used Holy Flower to carry out and perform miraculous healings. The anointing oil used by Jesus, who certainly was a cannabis user, and his disciples, contained an ingredient called Kaneh-bosem which has since been identified as cannabis extract, according to an article by Chris Bennett in the drug magazine High Times, entitled Was Jesus a Stoner? The incense used by Jesus in ceremonies also contained a cannabis extract, suggests Mr. Bennett, who quotes scholars to back his claims.

Carl Ruck, a professor of classical mythology at Boston University states, "There can be little doubt about a role for cannabis in Judaic religion." Referring to the existence of cannabis in anointing oils used in ceremonies. He added, "Obviously the easy availability and long-established tradition of cannabis in early Judaism would inevitably have included it in the (Christian) mixtures.

Another profound statement from Mr. Bennett suggests those anointed with the oils used by Jesus were "literally drenched in this potent mixture although most modern people choose to smoke or eat the Holy Flower, when its active ingredients are transferred into an oil-based carrier, it can also be absorbed through the skin."

Quoting the New Testament, Mr. Bennett argues that Jesus anointed his disciples with the oil and encouraged them to do the same with the other followers. This could have been responsible for healing eye and skin diseases referred to in the Gospels.

This powerful and truthful statement from Mr. Bennett concludes, "If cannabis was one of the main ingredients of the ancient anointing oil and receiving this oil is what made Jesus Christ and his followers Christians, then persecuting those who cannabis could be considered anti-Christ." I couldn't agree more with this statement.

Holy Flower has been used globally dating back for centuries throughout India, China, Africa, and Assyria. It was used for medicinal, spiritual, and recreational purposes.

Medicinal use of Holy Flower dates back at least 5,000 years, as such cannabis history is tied to many iconic time periods. Examples of this are:

- The ancient Egyptians reportedly used marijuana to treat glaucoma as well as general inflammation.
- Chinese Emperor Fu His called cannabis a popular medicine in 2900 BC, and the Chinese had identified more than 100 medical uses for Holy Flower by 100 AD.
- In 1,000 BC, the Indians created a drink called Bhang, a mixture of marijuana, milk, and other ingredients, and used it as anti-phlegmatic and anesthetic. This drink is currently used in India.

Like Jesus, ancient Indians have used Holy Flower as a cure for:

- *Leprosy
- *Dysentery
- *Cure fever
- *Insomnia

*Improve judgement & cognition

It is also thought to prolong healthy life. Other ancient cultures also used Holy Flower. The ancient Greeks used it for:

- *Inflammation
- *Earaches
- *Swelling

In 70 AD, Roman medical texts listed it as a cure for earache and as a way to suppress sexual desire. The Romans also boiled the roots of the plant and used them as a treatment for:

- *Gout
- *Arthritis
- *Generalized pain

The Arabians used it from 800 AD to 900 AD for:

- *Migraines
- *Syphilis
- *Pain

The English also documented many medicinal uses of Holy Flower for ailments, such as:

- *Menstrual cramps
- *Convulsions
- *Rheumatism
- *Gout
- *Joint pain
- *Muscle spasms
- *Insomnia and sleep problems
- *Childbirth (to promote uterine contractions)

Spiritual History of Holy Flower

Holy Flower has a very long history spiritually. It is said the Hindu god Shiva rested under a cannabis plant and ate its leaves following a family argument. Sounds to me a great way to overcome the tension and stress of any heated situation. Shiva is referred to as the Lord of Bhang. The Vedas, a collection of ancient scriptures, refer to Holy Flower as an herb to release people from anxiety. One story in the Vedas describes a drop of heavenly nectar falling on the earth and becoming the cannabis plant.

In his Histories, Greek Historian Herodotus described cannabis being smoked for spiritual, emotional, and sometimes recreational purposes. He discussed groups coming together and smoking, stating that the people smoking marijuana would “howl with pleasure!”

Marijuana has had a long and very rocky past in the United States since this country was formed. Originally used as a textile material and later a medicinal ingredient, this awesome plant became highly controversial through the years. Below is the Holy Flower timeline in the United States:

1600s

The origins of marijuana in the United States can be related back to the earliest days of settlement when hemp was grown like any other crop. In the 17th century, the production of hemp-a variety of the cannabis plant-was highly encouraged to make:

- *Clothing
- *Rope
- *Sails

In 1619, the Virginia Assembly passed legislation requiring that all farms grow hemp. Some states even traded hemp as legal tender.

1700s

George Washington, our first United States president, was interested in farming hemp. But he also questioned the potential of marijuana in his journals in 1765.

1840

Marijuana became widely accepted in mainstream medicine and was an ingredient in many over-the-counter products.

1850

Holy Flower was added to the U.S. Pharmacopeia. It was used as a treatment for:

- *Opioid withdrawal
- *Pain
- *Appetite stimulation
- *Relief of nausea and vomiting

1862

Hashish candy was advertised in an issue of Vanity Fair as a pleasurable and harmless stimulant that could cure melancholy and nervousness.

1906

The Food and Drug Act required that any product containing cannabis be labeled appropriately.

1900-1930

For 3 decades, Holy Flower was an ingredient in a variety of medications. It was marketed as a painkiller but was also used for sedation and to treat muscle spasms. However, during this same time, Mexican immigrants introduced recreational use of marijuana. Because the drug became associated with Mexican Immigrants, people began to fear the drug, anti-drug campaigners who were clearly ignorant referring to it as the “Mexican Menace.”

1914-1925

Twenty-six states passed laws prohibiting marijuana. These laws passed readily and easily with little to no public outcry or political debate.

Even though this was a century ago, and research was not so readily at our ancestors' fingertips, in my opinion, the laws passing prohibiting Holy Flower with the American people in such a passive state of being and clearly not awakened to the fact of the plethora of benefits the glorious plant has which has been proven by many generations on a global scale. Instead of just going along with a person's belief in it being harmful or evil as some have said, take the time to educate yourself by truly weighing the pros and cons and reviewing factual evidence from the many documented sources available. Let's continue.

1930s

The Great Depression resulted from job loss for many Americans. This created more fear and stigmatization of Mexican immigrants as many Americans worried, they would take away their jobs. This led to more public concern over the dangers of marijuana. The media began to report that research showed that marijuana use was linked to "crime and violence". At the same time, Harry Anslinger, commissioner of the Federal Bureau of Narcotics, began a campaign to criminalize marijuana, claiming that it led to insanity. That statement alone is insane. As a result of his efforts, by 1936, all states had some form of marijuana regulation laws.

1936

The film *Reefer Madness* was released. It depicted marijuana as a drug that could lead to:

- *Violence
- *Rape
- *Suicide
- *Psychosis

1937

The Marijuana Tax Act was passed which restricted marijuana use to only those that could pay a heavy excise tax for specific authorized industrial and medical uses.

1942

Marijuana was removed from the U.S. Pharmacopoeia and doctors began to discredit marijuana as not having any medicinal use.

1944

The New York Academy of Medicine published a report stating that marijuana was only a mild intoxicant. Harry Anslinger responded to this report with a solicited article in the *American Journal of Psychiatry* that attempted to attack and discredit the information they had previously published.

1952

The Boggs Act passed, creating strict mandatory punishments for offenses involving marijuana and a variety of other drugs.

1960s

Marijuana gained popularity among the counterculture who considered it a harmless high. Its use was popular among college students, free-spirited, anti-war activists, hippies, and other youth. President John F. Kennedy and Vice President Lyndon Johnson commissioned reports that found that marijuana did not induce violence or lead to use of other more dangerous drugs.

1965-1970

Marijuana arrests on the state level increased tenfold as authorities began to crack down on marijuana use and distribution.

1970

Congress passed the Controlled Substances Act, which placed marijuana as a Schedule I drug along with LSD and heroin. According to the act, marijuana had no medicinal value, and a high potential for abuse, giving it harsher criminal penalties. This law made it difficult for doctors and scientists to study marijuana and its many uses. Despite federal efforts to strengthen enforcement of strict marijuana laws, states the following all decriminalized such as:

*Oregon

*Maine

*Alaska

1972

The Shafer Committee recommended that personal use of marijuana be decriminalized. But President Nixon ignored their recommendations.

1976

The parents' movement against marijuana began, as more and more parents feared the drug and sought to prevent use in teens. Their efforts were strengthened by the Drug Enforcement Administration and the National Institute on Drug Abuse.

1980s-1990s

The public opinion of marijuana shifted back to it being dangerous, as many considered it a gateway drug to harder drugs such as:

*Cocaine

*Heroin

1982

First Lady Nancy Reagan started the "Just Say No" campaign.

1983

The Drug Abuse Resistance Education (DARE) program was established, which brought police officers into schools to discuss the dangers of drug abuse. Funding and use of this program was later cut back as research showed that it did not lead to decreased drug use in youth.

1986

President Ronald Reagan signed The Anti-Drug Abuse Act. This law raised marijuana penalties and created mandatory sentences many of which equated marijuana with heroin.

1989

President George H.W. Bush declared a “New War on Drugs” and continued anti-marijuana campaigns.

1996

California voters approved Proposition 215, which legalized marijuana for medicinal use at the state level.

1998-1999

The Clinton Administration spent \$25 million on television campaigns that placed drug messages in primetime TV shows.

Marijuana remains illegal under federal law in the United States, although the laws on the state level are increasingly changing more than 20 states now permit the sale of Holy Flower, either medical or medical and recreational, in various forms to inhale, consume or prescription form. There presently two FDA approved medications on the market:

*Marinol (Dronabinol)

*Cesamet (Nabilone)

Both are synthetic cannabinoids used to treat nausea or neuropathic pain. Other drugs in clinical testing are:

*Epidelix-used to treat childhood seizures

*Sativex-for cancer pain

In 2014, Colorado was the first state to legalize Holy Flower recreational use. Alaska, California, and Washington followed suit. Along with Massachusetts and Washington D.C. as well as Nevada deciding recreational being legal is the only way to go.

While Holy Flower is still unfortunately illegal on the federal level, doing the scientific research for medicinal purposes has been made rather difficult as well as dispensaries running the risk of being close down by the Drug Enforcement Administration. As time progresses and the more people in general across the country are urging lawmakers to pass legalization, the more states will become legal not only for medical patients but also for recreational us

Best Consumption Methods of Holy Flower for the Side Effects and Symptoms of Dysthymic Disorder

A good rule of thumb when new to Holy Flower to treat the side effects and symptoms of dysthymic disorder, to start with a low dose and don't take unnecessary amount until you fully realize the effects of your first dose. Depending on the form of Holy Flower will also determine how fast you will feel the effects. It is best to experiment with multiple strains, correct dosing,

and consumption methods to determine which one works best for you. Listed below are different forms of Holy Flower methods:

Inhalation Methods

With inhalation methods, the effects are almost immediate. Forms include:

- *Machine or hand-rolled joints
- *Dabbing
- *Vapor inhalation
- *Bong or pipe

Oral Administration

When you take cannabis orally. The absorption is slower with reduced circulation of the drug into your system and delayed peak levels of THC. Forms of taking Holy Flower orally include:

- *Edibles
- *Tinctures or sprays
- *Ingestible oils
- *Capsule and pills

Topical Methods

Topical methods are infused and are applied directly to your skin. Topicals include:

- *Lotions
- *Creams
- *Salves
- *Balms

Holy Flower Strains by Symptom Category

On the following pages, I have compiled researched lists of Holy Flower strains by symptom category. The strains are listed alphabetically and numerically by THC percentage from lowest to highest percentages. The strains include:

- *Indica and Indica-Dominant (I and I-D)
- *Sativa and Sativa-Dominant (S and S-D)
- *Hybrid (50/50 Indica/Sativa strains) (H)

Indica and Indica-Dominant Strains

Indica and Indica-Dominant strains are best used in the evening and nighttime as the effects will include:

- Body melt-Effortless muscle loosening
- Couch lock-A willingness to stop, be still, and be in the moment
- Munchies-Expect an intense desire to eat
- Sedative-A relaxed nudge toward sleep
- Laid back-cool and collective mood (anxiety lifter)
- Excellent pain relief
- Great stress reliever

Sativa and Sativa-Dominant Strains

Sativa and Sativa-Dominant strains are best used in the morning and during the day as their effects are opposite of the Indica and Indica-Dominant strains. These effects include:

- Energetic, euphoric, and uplifting
- Spacey, cerebral, and hallucinogenic
- Stimulates your appetite
- Relieves depression
- Increases your focus and alertness
- Expands your creativity and thoughts

Hybrids are an even 50/50 blend of both Indica and Sativa effects.

Holy Flower strains can be purchased at your local dispensary where the budtenders can further assist you in your purchase. The strain lists are expansive and not every dispensary will carry each and every one of them, so it is best to preview the dispensary menu before placing your order. If you have a green thumb, you can obtain Holy Flower seeds online from a reputable company. I have listed 10 companies that rank as the top seed banks. If you are new to Holy Flower, it is best to experiment with multiple strains and consumption methods to find the right ones for you.

1. [ILGM](#) - Best US seed bank overall (free shipping)
2. [Seedsman](#) - 4,400+ cannabis seeds
3. [Crop King Seeds](#) - 24/7 live chat and toll-free number
4. [Herbies Seeds](#) - High-THC (33%+) seeds
5. [Seed Supreme](#) - 100+ landrace and Kush strains
6. [Rocket Seeds](#) - 20+ breeders worldwide
7. [Quebec Cannabis Seeds](#) - Great seeds for short seasons
8. [Mary Jane's Garden](#) - Good high-CBD seeds
9. [Sonoma Seeds](#) - Helpful customer service
10. [Beaver Seeds](#) - High germination rate

Prescription Medications

Traditional physicians rely on different types of antidepressants that have a laundry list of side effects, and most often require additional medications to combat the side effects. These are commonly prescribed to treat dysthymic disorder include:

- *Selective serotonin reuptake inhibitors (SSRIs)
- *Tricyclic antidepressants (TCAs)
- *Serotonin and norepinephrine reuptake inhibitors (SNRIs)

Selective Serotonin Reuptake Inhibitors (SSRIs)

Selective serotonin reuptake inhibitors (SSRIs) are the most commonly prescribed antidepressants. They can ease symptoms of moderate to severe depression, are relatively safe and typically cause fewer side effects than other types of antidepressants do.

How SSRIs Work

SSRIs treat depression by increasing levels of serotonin in the brain. Serotonin is one of the chemical messengers (neurotransmitters) that carry signals between brain nerve cells (neurons). SSRIs block the reabsorption (reuptake) of serotonin into neurons. This makes more serotonin available to improve transmission of messages between neurons. SSRIs are called selective because they mainly affect serotonin, not other neurotransmitters.

The Food and Drug Administration (FDA) has approved these SSRIs to treat depression:

- *Citalopram (Celexa)
- *Escitalopram (Lexapro)
- *Fluoxetine (Prozac)
- *Paroxetine (Paxil, Pexeva)
- *Sertraline (Zoloft)

Possible Side Effects and Cautions of SSRIs

All SSRIs are thought to work in a similar way and generally can cause similar side effects, though some people may not experience any. SSRIs differ in their potencies at blocking serotonin reuptake and in how quickly the body eliminates (metabolizes) the drug.

Side effects of SSRIs may include, among others:

- *Nausea, vomiting or diarrhea
- *Headache
- *Drowsiness
- *Dry mouth
- *Insomnia
- *Nervousness, agitation, or restlessness
- *Dizziness
- *Sexual problems, such as:
 - *Reduced sexual desire
 - *Difficulty reaching orgasm
 - *Inability to maintain an erection (Erectile dysfunction)
 - *Loss of appetite
 - *Weight loss or weight gain

SSRIs Safety Issues

Higher doses may cause dangerous abnormal heart rhythms, and doses over 40 milligrams (mg) a day should be avoided according to the FDA and manufacturer.

Drug Interactions

When taking an antidepressant, tell your physician about any other prescription or over the counter medications, herbs, or other supplements you are taking. Some antidepressants can interfere with the effectiveness of other medications, and some can cause dangerous reactions when combined with certain medications or herbal supplements.

SSRIs may increase your risk of bleeding, especially when you are taking other medications that increase the risk of bleeding such as:

- *Nonsteroidal anti-inflammatory drugs (NSAIDs)
- *Aspirin
- *Warfarin (Coumadin, Jantoven)
- *Other blood thinners

Another aspect to consider with taking SSRIs, is stopping antidepressants abruptly or missing several doses can cause withdrawal like symptoms. This is sometimes called discontinuation syndrome. Withdrawal-like symptoms can include:

- *General feeling of uneasiness
- *Nausea
- *Dizziness
- *Lethargy
- *Flu-like symptoms

Tricyclic Antidepressants

Tricyclic antidepressants (TCAs) are a group of medications that all have similar structure and all work in a similar way. TCAs work by increasing levels of two neurotransmitters (these are chemicals that relay messages in the brain), Norepinephrine and serotonin. Norepinephrine helps with attention and modulates emotional response. Serotonin is often referred to as the “feel good hormone”. It carries messages between brain cells and contributes to:

- *Well-being
- *Good mood
- *Appetite
- *Helps with the body’s sleep-wake cycle and internal clock

TCAs may also block the actions of other neurotransmitters, such as:

- *Acetylcholine
- *Histamine

Some TCAs affect these neurotransmitters more than others which explains why some TCAs work better for conditions other than depression or are more likely to cause side effects such as:

- *Constipation
- *Dry mouth
- *Sedation

What are the Differences Between Tricyclic Antidepressants?

Although all TCAs are thought to act in the same way, with some slight variations in their effect on certain neurotransmitters, there are differences between individual TCAs with regards to:

- *How long they remain in the body
- * How they are metabolized
- *Their propensity for interactions with other medications
- *Their side effects

For example, amitriptyline, doxepin, imipramine, trimipramine are more likely to cause sedation than nortriptyline and desipramine.

Amitriptyline, doxepin and imipramine have been associated with more weight gain than some other TCAs; nortriptyline and desipramine may be better tolerated. Some TCAs such as amoxapine, are often listed as a TCA, but are in fact tetracyclic antidepressants.

<u>Generic</u>	<u>Brand Name</u>
Amitriptyline	Generic only
Amoxapine	Asendin
Clomipramine	Anafranil
Desipramine	Norpramin
Doxepin	Sinequan
Imipramine	Tofranil
Nortriptyline	Pamelor
Protriptyline	Vivactil
Trimipramine	Surmontil

These are associated with a few severe side effects, some potentially fatal, such as:

-An increase in suicidal thoughts and behaviors, particularly in children and young adults under the age of 25 years. This is most likely to occur when starting therapy.

Serotonin syndrome-this is caused by excessive levels of serotonin in the body and is more likely to occur with a higher dosage of SSRIs or when SSRIs are administered with other medications that also release serotonin. Symptoms include:

- *Agitation
- *Confusion
- *Sweating
- *Tremors
- *A rapid heart rate
- *The precipitation of a manic episode in people with undiagnosed bipolar disorder
- *An increased risk of seizures in people with a history of seizures
- *An increased risk of arrhythmias, heart attacks, stroke, and other cardiovascular effects, particularly in people with pre-existing heart disease
- *Triggering of an angle closure attack in people with angle-closure glaucoma

The side effects of tricyclic antidepressants include:

- *A drop in blood pressure when moving from a sitting to standing position
- *Blurred vision
- *Constipation
- *Disorientation or confusion

- *Drowsiness
- *Dry mouth
- *Excessive sweating
- *Increased or irregular heartbeat
- *Sexual dysfunction (such as reduced desire or erectile dysfunction)
- *Tremor
- *Urine retention
- *Weight loss or weight gain

List of Tricyclic Antidepressants

<u>Name Brand</u>	<u>Generic</u>
Elavil (Pro)	Amitriptyline
Silenor (Pro)	Doxepin
Anafranil (Pro)	Clomipramine
Pamelor (Pro)	Nortriptyline
Trofranil (Pro)	Imipramine
Sinequan	Doxepin
Norpramin	Desipramine
Aventyl Hydrochloride	Nortriptyline
Vivactil	Protriptyline
Asendin	Amoxapine
Vanatrip	Amitriptyline
Surmontil	Trimipramine
Tofranil-PM	Imipramine

Serotonin and Norepinephrine Reuptake Inhibitors (SNRI)

SNRIs work by blocking the reabsorption (reuptake) of the brain chemicals serotonin and norepinephrine. They were first introduced in the mid-1990s.

Types of SNRIs

Some common SNRIs include:

- *Pristiq (desvenlafaxine)
- *Cymbalta (Duloxetine)
- *Savella (milnacipran)
- *Effexor (venlafaxine)
- *Fetzima (levomilnacipran)

The side effects of SNRIs may include:

- | | |
|-----------------------|--|
| *Dizziness | *Nausea |
| *Dry mouth | *Sweating |
| *Tiredness | *Insomnia |
| *Anxiety & agitation | *Constipation |
| *Difficulty urinating | *Headache |
| *Loss of appetite | *Reduced sexual desire or problems with sexual arousal |

Individuals taking an antidepressant should be watched closely for worsening depression or unusual behavior, especially when first beginning a new medication or with a change in dosage. Suicidal thoughts may occur, while taking an antidepressant, please get help immediately.

Psychotherapy

Psychotherapy is a general term for treating depression by talking about your condition and related issues with a mental health professional. Psychotherapy is also known as talk therapy or psychological counseling, and may include different types of psychotherapy, such as, interpersonal therapy and cognitive behavioral therapy, can be effective for dysthymic disorder. Your therapist and you can discuss which type of therapy is right for you, your goals for therapy and other issues, such as length of treatment. Psychotherapy can help you:

- Adjust to a crisis or other current difficulty
- Identify issues that contribute to your depression and change behaviors that make it worse
- Identify negative beliefs and behaviors, and replace them with healthy positive ones
- Find better ways to cope and solve problems
- Explore relationships and experiences, and develop positive interactions with others
- Regain a sense of satisfaction and control in your life and help ease depression symptoms, such as:
 - *Hopelessness
 - *Anger
- Learn to set realistic goals for your life

Behavioral Activation

A therapist help you learn which activities you could be neglecting as a result of your dysthymic disorder. The goal is to have you re-incorporate these activities into your life to positively impact your mood.

Lifestyle and Home Remedies

Dysthymic disorder generally is not a condition that can be treated on your own. In addition to professional treatment, adjusting certain habits could help you alleviate dysthymic disorder.

These include:

- *Getting adequate sleep
- *Incorporating a healthy diet
- *A regular exercise routine
- *Establish small goals
- *Eliminate alcoholic beverages

Although there is no way to fully prevent dysthymic disorder, the medical community suggests observing closely for dysthymic disorder in children and in teenagers as well as into the adult years.

Unfortunately, a common theme exists with this disorder whereby a substantial number of sufferers do not enjoy a sustained recovery. Physicians and psychotherapists recommend maintenance treatment to reduce the risk of relapse.

Stick to your Treatment Plan

Do not skip psychotherapy sessions or appointments, and even if you are feeling well, it is best not to skip your medications. Give yourself time to improve gradually.

Learn About Dysthymic Disorder

Education about your condition can empower you and motivate you to stick to your treatment plan. Encourage your family to learn about the disorder to help them understand and support you.

Pay Attention to Warning Signs

Work with your physician or therapist to learn what might trigger your symptoms. Make a plan that you know what to do if symptoms get worse or return. Contact your physician and therapist if you notice any changes in symptoms or how you feel. Consider involving family members or friends to watch for warning signs.

Take Care of Yourself

Self-care is a priority. It is best to eat healthy, be physically active and get plenty of sleep.

Consider physical activity such as:

- *Walking
- *Swimming
- *Gardening
- *Bike riding
- *Jogging
- *Yoga
- *Hiking
- *Activities that you enjoy

Sleeping well is important for both your physical and mental well-being. If you are having trouble sleeping, talk to your doctor about what you can do.

Avoid Alcohol

It may seem like alcohol lessen depression-related symptoms, but in the long run they generally worsen depression and make it harder to treat. Talk with your physician or therapist if you need help dealing with alcohol.

Coping and Support

Dysthymic disorder makes it hard to engage in behavior and activities that can help you feel better. In addition to the treatments recommend by your physician or therapist, consider these tips:

Focus on Your Goals

Dealing with dysthymic disorder is an ongoing process. Set reasonable goals for yourself. Stay motivated by keeping your goals in mind. But give yourself permission to do less when you feel down.

Simplify Your Life

Do what is best for you by setting boundaries and cut back on obligations when possible. Structure your time by planning your day. You may find it helps to make a list of daily tasks, use sticky notes as reminders or use a planner to stay organized.

Keep a Journal

Journaling as part of your treatment may improve mood by allowing you to express:

- *Pain
- *Anger
- *Fear
- *Other emotions

Read Reputable Self-Help Books and Websites

Ask your physician or therapist to recommend books or websites that are geared towards self-help and empowerment.

Stay Connected

Do not become isolated. It is best to participate in social activities and get together with family or friends regularly. Support groups for people with depression can help you connect with others facing similar challenges and sharing experiences.

Learn Ways to Relax and Manage Your Stress

It is important for your entire mind, body, spirit, and soul to find different ways to relax and manage your stress. Examples of this include:

- *Meditation
- *Yoga
- *Tai Chi
- *Progressive muscle relaxation

Avoid Making Important Decisions When You Are Down

Avoid decision-making when you are feeling depressed and down, since you may not be thinking clearly. By avoiding doing this, you will prevent regret on these decisions at a later time.

Best Diet for Dysthymic Disorder

The best diet for depression has multiple elements. What this means the main point of a diet is to increase mental health and well-being. A good diet plan when implemented in your daily life will become natural and pleasant part of your life.

Think of this diet plan to reduce dysthymic disorder as part of a balanced, healthy lifestyle. Nutrition is vital for mental health, and a fancy or fad diet is not necessary. Often times special diets don't last causing people to revert to unhealthy eating habits.

An effective, user-friendly, healthy diet plan for depression involves these simple elements:

- *What to eat
- *How you eat
- *When you eat

A diet plan for depression and what you eat matters. The brain needs nutrients to function well. In both depression and anxiety, the balance of certain neurotransmitters:

- *Serotonin
- *Gamma-aminobutyric acid (GABA)
- *Noradrenaline
- *Dopamine-is off

Too much or too little of these chemicals disrupts mental health. Researcher are discovering that diet and nutrition are key factors in the production of neurotransmitters.

Neurochemicals are made in both the brain and gut directly from the foods we eat. The quality of our brain chemistry is connected to the quality of our diet. The simplest nutritional guideline included in a diet plan for depression and anxiety is to eat more healthy foods and fewer junk foods. The brain depends on certain foods to get nutrients it needs to stave off depression and anxiety. In general, a diet plan includes:

- *Protein
- *Complex carbohydrates
- *Omega-3 Fatty acids
- *B vitamins
- *Minerals

The examples above are just a few of the foods that combat depression in each category:

- *Whole grain breads, pastas, cereals, and oatmeal
- *Turkey and other lean meats
- *Eggs
- *Cheese
- *Fruits
- *Vegetables-spinach and other dark green veggies are excellent but not the only vegetables that boost the brain
- *Nuts-walnuts, almonds, and pistachios are notable depression fighters
- *Seeds
- *Avocados
- *Salmon, tuna
- *Yogurt with probiotics
- *Dark chocolate-about 40g a day (about 1.5oz) of 74% or higher

The following is a list of foods to avoid and will increase your chances of having depression:

- *Junk food
- *Saturated and trans fats
- *Simple carbohydrates (refined sugars)
- *Heavily processed foods
- *Sugary foods and drinks
- *Sugar substitutes, like:
- *Aspartame
- *Omega-6 fatty acids (polysaturated cheap oils)

The worst beverages for depression that is recommended to avoid as they worsen or contribute to depression include:

- *Fruit juice (it is simple sugar)

- *Soda (also a simple sugar, plus studies link it directly to depression)
- *Alcohol (in excess, it can disrupt sleep, reduce serotonin levels, and negatively impact medication)
- *Coffee (this one's a maybe-for some, it interferes in sleep, while for others it provides energy and mood boosts. If you can drink coffee, avoid the sugary coffee drinks and coffee sweeteners)

The Foods you should absolutely avoid, as these may cause or worsen depression include:

- *Processed meats
- *Fried foods
- *Refined cereals
- *Chocolate and other candy
- *Sweet desserts
- *Cookies
- *Doughnuts
- *High-fat dairy products
- *Anything made with white flour (including bread, baked goods, pancakes, etc.)
- *Crackers and other snack food made with partially hydrogenated oils
- *Regular ketchup (it has a significant amount of added sugar or artificial sweeteners)

How to Eat

While the types of nutrients you give your brain is the biggest component of your positive diet plan, other things you do matter to your health and wellbeing as well. One such thing is how you eat.

Due to our schedules that tend to be fast paced and busy, it has become common to eat on the run or at your desk at work while working at the same time. Also standing at the kitchen counter quickly eating has also become the norm. These habits you create contribute to the increase of stress and anxiety. Another habit that has formed over the past several decades is eating in front of the t.v. or smart devices. When this happens, we eat mindlessly. These methods of eating detach us from those around us. It is difficult to fully connect with family staring at the t.v. or phone. All of this can contribute.
