

Endometriosis

Endometriosis (pronounced en-doh-me-tree-O-sis) is an often-painful, common, and chronic gynecological inflammatory disorder in which tissue similar to the tissue that normally lines the inside of your uterus-the endometrium-grows outside your uterus. Endometriosis usually develops several years after the onset of menstruation (menarche). Signs and symptoms of endometriosis may temporarily improve with pregnancy and may go away completely with menopause unless you are taking estrogen. Endometriosis most commonly involves your:

- *Ovaries
- *Fallopian tubes
- *The tissue lining your pelvis

Rarely, endometrial-like tissue may be found beyond the area where pelvic organs are located. These tissue deposits cause an inflammatory reaction that results in:

- *Scar-tissue
- *Severe pain
- *Adhesion formation

Experts believe the tissue deposits react to the same hormonal stimulation as normal endometrium consequently, symptoms are usually worse at particular times during the cycle, especially before and during a period.

With endometriosis, the endometrial-like tissue acts as endometrial issue would-it thickens, breaks down and bleeds with each menstrual cycle. But because this tissue has no way to exit your body, it becomes trapped. When endometriosis involves the ovaries, cysts called endometriomas may form. Surrounding tissue can become irritated, eventually developing scar tissue and adhesions-bands of fibrous tissue that can cause pelvic tissues and organs to stick to each other.

Endometriosis can cause pain-sometimes severe-especially during menstrual periods. Endometriosis is often so severe that it forces females to leave the workplace and receive expensive care. Aside from the cost, traditional treatments, such as:

- *Prescription medications, such as opioids
- *Over the counter (OTC) pain medication

More women are receiving effective benefits through the use of Holy Flower. Fertility problems also may develop. Fortunately, effective treatments are available.

History of Endometriosis

Using histological endometrial activity and structure parameters Cullen was the first scientist to define peritoneal endometriosis as "adenomyoma". Rokitansky described an adenomatous polyp (a form of adenomyosis) first.

Early ovarian endometrioma descriptions as “chocolate cysts” or “hematomas of the ovary” go back as far as the end of the 19th century. In 1899, Russel published “Ovary Containing Uterine Mucosa,” but the first to exhibit specific endometrial activities like decidualization in pregnancy and desquamation during menstruation was Sampson-he afterward presented his theory on its development.

Endometriosis Statistics

According to The American College of Obstetricians and Gynecologists (ACOG), endometriosis statistics include:

- Endometriosis affects approximately one in 10 women in their reproductive years-typically between 15-49 years old.
 - Endometriosis affects approximately 176 million women in their reproductive years worldwide. New England Journal of Medicine published studies that show endometriosis is among the leading three causes of infertility in women.
 - Up to 30 to 50% of women with the condition can experience infertility.
 - Endometriosis affects approximately 10% of women of childbearing age.
 - An estimated 7.6 million women in the United States alone experience this agonizing condition.
 - As many as 50% of infertile women have endometriosis
- The National Institutes of Health (NIH) had a budget of over \$37 billion in 2018. Endometriosis research received just \$7 million.

Noemie Elhadad of Columbia University created an app called Phendo 2018 to help women worldwide. The goal of the app is to track the effects of endometriosis. By early 2019, the app had 6,000 participants in over 65 countries.

The American Society of Reproductive Medicine (ASRM) developed a staging system, which can be found below. Patients should note that the disease stage doesn't necessarily indicate symptoms nor the best treatment to manage these symptoms.

Stages 1 & 2

Minimal to mild disease. In these stages, women will likely have smaller shallower lesions. Scar tissue might be present.

Stages 3 & 4

Moderate to severe disease. Sufferers may have deeper lesions, plus adhesions between the uterus and bowels. There is also a chance of cysts.

Types of Endometriosis

Several types of endometriosis exist. If you receive a diagnosis your physician will discuss the type you have with you. When you know the details about the kind of endometriosis you have,

it will not just help you make an informed decision regarding your treatment, but it also provide you with knowledge about your condition which will empower you. The different types include:

Superficial Endometriosis

While this is a misleading label, this type of endometriosis does cause a lot of pain. It is only named superficial because there isn't much mass in the endometrial lesions. It is hard for doctors to see them on a sonogram, and typically, they're only detected with the use of a laparoscope. The lesions are generally around a couple of centimeters wide and may be blue, red, or black. Red lesions tend to be more active. A white area may surround the superficial lesions, indicating scarring.

Deep Infiltrating Endometriosis

This a rare form of endometriosis believed to cause the most pain out of all types. With this type, the lesions penetrate your bladder, bowel, and vagina five mm or more. They may even penetrate the obturator and sciatic nerves, resulting in debilitating pain.

Cystic Ovarian Endometriosis

These cysts have bloody, brown fluid inside then that look like soft chocolate- therefore they're referred to as chocolate cysts. They are typically around three to four cm in diameter, but in rare cases, they can grow as big as 15 cm. They are also often linked with infertility.

Causes of Endometriosis

No one knows for sure what causes endometriosis. Endometriosis is sometimes mistaken for other conditions that can cause pelvic pain, such as:

- *Pelvic Inflammatory Disease (PID)
- *Ovarian cysts

It may be confused with irritable bowel syndrome (IBS), a condition that causes bouts of:

- *Diarrhea
- *Constipation
- *Abdominal cramping

IBS can accompany endometriosis, which can complicate the diagnosis. Although the exact cause of endometriosis is not certain, possible explanations include:

Retrograde Menstruation

In retrograde menstruation menstrual blood containing endometrial cells flows back through the fallopian tubes and into the pelvic cavity instead of out of the body. These endometrial cells stick to the pelvic walls and surfaces of pelvic organs, where they grow and continue to thicken and bleed over the course of each menstrual cycle.

Hormones

Estrogen (a hormone) seems to bring on endometriosis. Research is being conducted to see if endometriosis is a complication with your body's hormone system.

Transformation of Peritoneal Cells

In what's known as the "Induction theory" experts propose that hormones or immune factors promote transformation of peritoneal cells-cells that line the inner side of the abdomen-into endometrial-like cells.

Genetic Factors

Endometriosis can run in families making you genetically predisposed to the condition.

Embryonic Cell Transformation

Hormones such as estrogen may transform embryonic cells-cells in the earliest stages of development-into endometrial-like cell implants during puberty.

Surgical Scar Implantation

After a surgery, such as a hysterectomy or c-section, endometrial cells may attach to a surgical incision.

Endometrial Cell Transport

The blood vessels or tissue fluid (lymphatic) system may transport endometrial cells to other parts of the body.

Immune System Disorder

If you have a faulty immune system, it could fail to identify and destroy the endometrial tissue you have growing outside your uterus. Certain cancer and immune system disorders are more common in endometriosis patients.

Effects of Endometriosis

Complications of endometriosis may include:

- *Ovarian cysts
- *Infertility-affects around 50% of individuals with endometriosis
- *Inflammation
- *Increased risk of endometriosis linked adenocarcinoma or ovarian cancer
- *Bladder and intestinal complications
- *Adhesion and scar tissue development

Mental Effects

Psychological factors help physicians determine how severe symptoms are. Women suffering from endometriosis report high incidences of:

- *Depression
- *Anxiety
- *Other psychiatric conditions

These high levels of depression and anxiety may intensify the severity of pain. Some studies show women with endometriosis who are sleep deprived can struggle with metabolic and hormonal changes as well as increased levels of pain and inflammation.

Risk Factors of Endometriosis

There are several factors that place you at greater risk of developing endometriosis, such as:

- Never giving birth
- Starting your period at an early age
- Going through menopause at an older age
- Short menstrual cycles-for instance less than 27 days
- Heavy menstrual periods that last longer than seven days
- Having higher levels of estrogen in your body or a greater lifetime exposure to estrogen your body produces
- Low body mass index
- One or more relatives (mother, aunt, or sister) with endometriosis
- Any medical condition that prevents the passage of blood from the body during menstrual periods
- Disorders of the reproductive tract

Complications of Endometriosis

There are complications that are associated with endometriosis which include:

- *Infertility
- *Cancer

Infertility

The main complication of endometriosis is impaired fertility. Approximately one-third to one-half of women with endometriosis have difficulty getting pregnant. For pregnancy to occur, an egg must be released from an ovary, travel through the neighboring fallopian tube, become fertilized by a sperm cell and attach itself to the uterine wall to begin development.

Endometriosis may obstruct the tube and keep the egg and sperm from uniting. But the condition also seems to affect fertility in less-direct ways, such as by damaging the sperm or egg.

Even so, many with mild to moderate endometriosis can still conceive and carry a pregnancy to term. Physicians sometimes advise those with endometriosis not to delay having children because the condition may worsen with time.

Cancer

Ovarian cancer does occur at higher-than-expected rates in those with endometriosis. But the overall lifetime risk of ovarian cancer is low to begin with. Some studies suggest that

endometriosis increases that risk, but it is still relatively low. Although rare, another type of cancer-endometriosis-associated adenocarcinoma-can develop later in life in those who have had endometriosis.

Endometriosis Prevention

There is no way to completely prevent endometriosis, but you can lower your chances of developing it by lowering the levels of the hormone estrogen in your body. Estrogen helps to thicken the lining of your uterus during your menstrual cycle. To keep lower estrogen levels in your body you can take the following steps:

*Talk to your physician about hormone birth control methods such as:

-Pills

-Patches

-Vaginal rings with lower doses of estrogen

*Exercise regularly (more than 4 hours a week)

*Avoid large amounts of alcohol as it raises estrogen levels

*Avoid large amounts of drinks with caffeine. Drinking more than one caffeinated drink a day can raise estrogen levels

Symptoms of Endometriosis

The primary symptom of endometriosis is excruciating pelvic pain, often associated with menstrual periods. Although most women experience cramping during their menstrual periods, those with endometriosis typically describe menstrual pain that's far worse than usual. This pain typically lasts up to several days. Pain also may increase over time.

The condition is a chronic inflammatory reaction, leading to adhesions and pain. Adhesions occur when scar tissue attaches to separate organs or structures. Other symptoms may also occur around menstruation, such as:

*Fatigue

*Painful bowel movements

*Pain during sexual activity

*Rectal bleeding

*Constipation or diarrhea

*Insomnia

*Pain during ovulation

*Endometriosis also increases the risk of infertility

Painful Periods (dysmenorrhea)

Pelvic pain and cramping may begin before and extend several days into a menstrual period. You may also have lower back and abdominal pain.

Pain with Intercourse

Pain during or after sex is common with endometriosis.

Pain with Bowel Movements or Urination

You are most likely to experience these symptoms during a menstrual period.

Excessive Bleeding

You may experience occasional heavy menstrual periods (menorrhagia) or bleeding between periods (intermenstrual bleeding or menometrorrhagia)

Infertility

Physicians first diagnose endometriosis in some women looking for infertility treatment.

Other Signs and Symptoms

You may experience:

- *Fatigue
- *Diarrhea
- *Constipation
- *Bloating
- *Nausea

These symptoms happen especially during menstrual periods. The severity of your pain may not be a reliable indicator of the extent of your condition. You could have mild endometriosis with severe pain, or you could have advanced endometriosis with little or no pain.

What is it Like to Live with Endometriosis

“Hell” is the word women often use to describe life with endometriosis. Jill Fuersich is the co-founder of Endo Warriors, and she spoke of how the condition has negatively impacted her life. According to Jill, back and leg pain joined the agony caused by her bowels and bladder. Eventually, she couldn't function any longer and lost her job.

When to see Your Physician

When the symptoms of Endometriosis present themselves, it is recommended to see your physician as it can be a challenging condition to manage. An early diagnosis will give you a better understanding of Endometriosis and will result in better management of your symptoms.

Preparing for your Appointment

Your time will be limited at your scheduled appointment with your physician. It is best to prepare ahead of time to make great use of your time as your physician to address your health condition. If you are seeking treatment for infertility, you may be referred to a doctor who specializes in reproductive hormones and optimizing fertility (reproductive endocrinologist). The ways you can prepare include:

Journal Your Symptoms

Journaling the symptoms you are experiencing include the length of time. Include symptoms that may not be related as this will assist your physician with the diagnosis.

List Your Medications

Make a list of all medications you are taking, including:

- *Prescription medications
- *Herbal supplements
- *Vitamin supplements
- *Dosing instructions
- *Prescribing physicians
- *Length of time

If possible, have a family member or close friend accompany you to your appointment. You may get a lot of information at your visit, and it can be difficult to remember everything. Bring a notepad or electronic device with you. Use it to make notes of important information during your visit.

Prepare a List of Questions to Ask your Physician

List your most important questions first, to be sure you address those points. For endometriosis, some basic questions to ask your physician include:

- How is endometriosis diagnosed?
- What medications are available to treat endometriosis?
- Is there a medication that can improve my symptoms?
- What side effects can I expect from medications I use?
- Under what circumstances do you recommend surgery?
- Will I be prescribed and given medication before and after surgery?
- Will endometriosis affect my ability to become pregnant?
- Can treatment of endometriosis improve my fertility?
- Can you recommend any alternative treatments I might try?

Be sure you fully understand everything your physician tells you. If you have other questions include those as well. You will want to ask about any follow-up visits, tests, and anything else you are concerned about.

During your appointment your physician will also ask you a series of questions similar to the ones listed below. Be prepared to answer any questions they may ask.

- How often do you experience these symptoms?
- How long have you had these symptoms?
- How severe are your symptoms?
- Do your symptoms seem to be related to your menstrual cycle?
- Does anything improve your symptoms?
- Does anything make your symptoms worse?

Diagnosis of Endometriosis

Diagnosis of Endometriosis may not be so simple. A study by Hadfield et al., published in Human Reproduction in 1996, found that the average amount of time to diagnose endometriosis was 11.73 years (standard deviation 9.05 years) in the United States. In other words, women could have the condition for over ten years without realizing it. Fast forward a couple of decades, and little has changed.

Lack of diagnostic tools means that the scale of the problem is unknown. Tests to check for endometriosis include:

- *Pelvic exam
- *Ultrasound
- *Magnetic Resonance Imaging (MRI)
- *Laparoscopy

There is a specific diagnosis of endometriosis that requires a surgical biopsy. Many women with the condition have had at least one surgery. Numerous experts consider the laparoscopic removal of the endometrium as the most effective method of treatment.

To diagnose endometriosis and other conditions that can cause pelvic pain, your physician will ask you to describe your symptoms, including the location of your pain and when it occurs. Test to check for physical clues of endometriosis include:

Pelvic Exam

During a pelvic exam, your physician manually feels (palpates) areas in your pelvis for abnormalities such as:

- *Cysts on your reproductive organs
- *Scars behind your uterus

Often it is not possible to feel small areas of endometriosis unless they've caused a cyst to form.

Ultrasound

This test uses high-frequency sound waves to create images of the inside of your body. To capture the images, a device called a transducer is either pressed against your abdomen or inserted into your vagina (transvaginal ultrasound). Both types of ultrasound may be done to get the best view of the reproductive organs. A standard ultrasound imaging test won't definitely tell your physician whether you have endometriosis, but it can identify cysts associated with endometriosis (endometriomas).

Magnetic Resonance Imaging (MRI)

An MRI is an exam that uses a magnetic field and radio waves to create detailed images of the organs and tissues within your body. For some, an MRI helps with surgical planning, giving your surgeon detailed information about the location and size of endometrial implants.

Laparoscopy

In some cases, your physician may refer you to a surgeon for a procedure that allows the surgeon to view inside your abdomen (laparoscopy). While you are under general anesthesia your surgeon makes a tiny incision near your navel and inserts a slender viewing instrument (laparoscopy), looking for signs of endometrial tissue outside the uterus.

A laparoscopy can provide the location, extent and size of the endometrial implants, your surgeon may take a tissue sample (biopsy) for further testing. Often, with proper surgical planning, your surgeon can fully treat endometriosis during the laparoscopy so that you need only one surgery.

Holy Flower Effectively Treats for Endometriosis

Analgesic pain relievers and anti-inflammatories are the most common method of treating the pain resulting from endometriosis. However, there are also more natural, alternative treatments like cannabinoids, for instance. Even though medical marijuana for endometriosis isn't a cure, it does help to reduce pain effectively due to its CBD soothing properties.

Current Traditional Treatment for Endometriosis and The Side Effects

In 2014, the Endocrinology Society had a meeting to determine the costs associated with endometriosis. It was discovered that the average healthcare cost in the first year after diagnosis was over \$13,000. To make matters worse, Medicare covers only a fraction of the cost of laparoscopic surgery for the condition.

Other treatment options include pain medication such as opioids and NSAIDs. More women are turning to Holy Flower to find effective relief from the endometriosis symptoms.

While there is no cure for endometriosis, you can manage its symptoms. Treatment options may include:

Pain Medications

-OTC medicines like ibuprofen (Motrin IB, Advil)

-Naproxen (Aleve)

-Acetaminophen (Tylenol)

These are potential pain relievers, but they aren't always effective. Side effects of these pain medications may include:

*Stomach pain

*Headache

*Loss of appetite

*Nausea

*Dizziness

*Ringing in the ears

*Heartburn

*Gas

*Mild rash or itching

The prescription medications most commonly prescribed are listed below with the costs and side effects:

- *Prometrium (Progesterone)-\$41
- *Provera (Medroxyprogesterone)-\$36
- *Aygestin (Norethindrone acetate)-\$15
- *Orilissa (Elagolix)-\$1,076
- *Lupron Depot (Leuprolide)-\$1,596
- *Danazol (Danazol)-\$158
- *Depo-Subq Provera (medroxyprogesterone)-\$58
- *Synarel (Nafarelin)-\$3,033
- *Lupaneta-\$1,522
- *Zoladex-
- *Lo Loestrin Fe
- *Loseasonique-
- *Natazia-
- *Lupron Depot-
- *Sharobel or Errin-
- *Aygestin-
- *Mirena IUD-

Common side effects patients may experience:

- *Menstrual irregularities
- *Tender breasts
- *Dizziness
- *Nausea
- *Headache
- *Cramps
- *Irregular bleeding
- *Vomiting
- *Acne
- *Weight gain
- *Bloating

Hormonal Contraceptives

These prevent monthly endometrial tissue growth and buildup, resulting in decreased fertility.

These include:

- *Birth control patches
- *Pills
- *Vaginal rings

These reduce or even eliminate pain in cases of mild endometriosis.

*Depo-Provera (medroxyprogesterone injection) is another option to stop menstruation. It prevents endometrial implant growth and alleviates pain and other symptoms. You may want to consider other options first since this injection can increase your risk of:

- *Weight gain
- *Decreased bone production

*Depression

Hormonal Therapy

You may relieve your pain or even stop its progression by taking supplemental hormones your doctor prescribes to you. Hormonal therapy will help your body regulate monthly hormone changes promoting tissue growth with endometriosis.

Danazol

Danazol is another medicine physicians prescribe to reduce symptoms and stop menstruation. However, even when you take this medication, the condition can continue to progress. Some side effects of Danazol may include:

*Hirsutism

*Abnormal hair growth on the body or face, acne

Gonadotropin-Releasing Hormone (Gn-RH) Antagonists and Agonists

Females take GnRH antagonists and agonists to block ovary-stimulating estrogen production. Estrogen is a hormone in your body mostly responsible for developing women's sexual characteristics. This creates artificial menopause and prevents menstruation. You may experience side effects like hot flashes and vaginal dryness, but you can reduce or prevent these symptoms by taking small doses of progesterone and estrogen together.

Conservative Surgery

Conservative surgery is an option if you are experiencing severe pain, want to become pregnant or if hormonal treatments aren't effective. Physicians perform this surgery to destroy or remove endometrial growths without causing reproductive organ damage.

Another minimally invasive surgery, laparoscopy helps the surgeon view, diagnose, and eliminate the endometrial tissue. They'll make small abdominal incisions to surgically cut out the growths or vaporize or burn them. These days, lasers are becoming more common as a way to eliminate this displaced tissue.

Hysterectomy: Last-Resort Surgery

Your doctor may suggest this surgery only as a last resort if other treatments aren't improving your condition. Your surgeon will remove your cervix and uterus during a total hysterectomy. They will also remove your ovaries since these produce estrogen which causes endometrial tissue growth. They will also remove any noticeable implant lesions.

Again, surgeons typically only go this route when other treatments aren't working and when your inflammation and pain are affecting your quality of life. A hysterectomy stops your menstruation cycle and reduces endometriosis symptoms, but there isn't any guarantee it will eliminate your pain entirely.

A hysterectomy will also eliminate your chances of becoming pregnant. Therefore, you will want to obtain a second opinion and consider all your options carefully before you agree to this surgery if you want to start a family.

Recent Developments in Endometriosis Treatment

Newer treatments are being introduced such as:

- *Gonadotropin-releasing hormone analogs
- *Aromatase inhibitors
- *Selective estrogen or progesterone receptor modulators
- *Antiangiogenic agents
- *Immunomodulators

Scientists and the medical community need to conduct further research into local neurogenesis, central sensitization, and endometriosis genetics to identify other targets of treatment.

New surgery developments have also shown how useful endometriosis robotic surgery can be - though these methods aren't necessarily better than conventional laparoscopy. Also researchers are studying narrow band imaging, fluorescence imaging and other enhanced imaging techniques, but these haven't demonstrated any long-term clinical benefits as of yet.

A broader range of treatment options opens the door for a more personalized treatment plan and the possibility of precision health for women with endometriosis.

Treatment for endometriosis usually involves medication or surgery. The approach you and your physician choose will depend on how severe your signs and symptoms are and whether you hope to become pregnant. Physicians typically recommend trying conservative treatment approaches first, opting for surgery if initial treatment fails.

Pain Medication

Your physician may recommend that you take an over-the-counter pain reliever, such as:

- *Nonsteroidal anti-inflammatory drugs (NSAIDs)
- *Ibuprofen (Advil, Motrin IB, others)
- *Naproxen sodium (Aleve)

These are used to help ease painful menstrual cramps your physician may recommend hormone therapy in combination with pain relievers if you are not trying to get pregnant.

Hormone Therapy

Supplemental hormones are sometimes effective in reducing or eliminating the pain of endometriosis. The rise and fall of hormones during the menstrual cycle causes endometrial implants to thicken, break down and bleed. Hormone medication may slow down endometrial tissue growth and prevent new implants of endometrial tissue.

Hormone therapy isn't a permanent fix for endometriosis. You could experience a return of your symptoms after stopping treatment. Therapies used to treat endometriosis include:

Hormonal Contraceptives

- *Birth control pills

- *Patches
- *Vaginal rings

These help control the hormones responsible for the buildup of endometrial tissue each month. Many have lighter and shorter menstrual flow when they are using a hormonal contraceptive. Using hormonal contraceptives-especially continuous-cycle regimens-may reduce or eliminate pain in some cases.

Gonadotropin-Releasing Hormone (Gn-RH) Agonists and Antagonists

These drugs block the production of ovarian-stimulating hormones, lowering estrogen levels and preventing menstruation. This causes endometrial tissue to shrink. Because these drugs create an artificial menopause, taking a low dose of estrogen or progestin along with Gn-RH agonists and antagonists may decrease menopausal side effects, such as:

- *Hot flashes
- *Vaginal dryness
- *Bone loss

Menstrual periods and the ability to get pregnant return when you stop taking the medication.

Progestin Therapy

A variety of progestin therapies including:

- *An intrauterine device with levonorgestrel (Mirena, Skyla)
- *Contraceptive implant (Nexplanon)
- *Contraceptive injection (Depo-Provera)
- *Progestin pill (Camila)

These can halt menstrual periods and the growth of endometrial implants, which may relieve endometriosis signs and symptoms.

Aromatase Inhibitors

Aromatase inhibitors are a class of medicines that reduce the amount of estrogen in your body. Your physician may recommend an aromatase inhibitor along with a progestin or combination hormonal contraceptive to treat endometriosis.

Conservative Surgery

If you have endometriosis and are trying to become pregnant, surgery to remove the endometriosis implants while preserving your uterus and ovaries (conservative surgery) may increase your chances of success. If you have severe pain from endometriosis, you may also benefit from surgery-however endometriosis and pain may return.

Your physician may do this procedure laparoscopically or less commonly, through traditional abdominal surgery in more-extensive cases. Even in severe cases of endometriosis, most can be treated with laparoscopic surgery.

In laparoscopic surgery, your surgeon inserts a slender viewing instrument (laparoscopic) through a small incision near your naval and inserts instruments to remove endometrial tissue

through another small incision. After surgery, your physician may recommend taking hormone medication to help improve pain.

Fertility Treatment

Endometriosis can lead to trouble conceiving. If you are having difficulty getting pregnant, your physician may recommend fertility treatment supervised by a fertility specialist. Fertility treatment ranges from stimulating your ovaries to make more eggs to in vitro fertilization. Which treatment is right for you depends on your personal situation.

Hysterectomy with Removal of the Ovaries

Surgery to remove the uterus (hysterectomy) and ovaries (oophorectomy) was once considered the most effective treatment for endometriosis. But endometriosis experts are moving away from this approach, instead focusing on the careful and thorough removal of all endometriosis tissue. Having your ovaries removed results in menopause. The lack of hormones produced by the ovaries may improve endometriosis pain for some, but for others, endometriosis that remains after surgery continues to cause symptoms. Early menopause also carries a risk of heart and blood vessel (cardiovascular) diseases, certain metabolic conditions, and early death.

Removal of the uterus (hysterectomy) can sometimes be used to treat signs and symptoms associated with endometriosis, such as:

- *Heavy menstrual bleeding
- *Painful menses

Due to cramping, in those who don't want to become pregnant. Even when the ovaries are left in place, a hysterectomy may still have a long-term effect on your health, especially if you have the surgery before age 35.

Finding a physician with whom you feel comfortable is crucial in managing and treating endometriosis you may want to get a second opinion before starting any treatment to be sure you know all your options and the possible outcomes.

Lifestyle and Home Remedies

If your pain persists or if finding a treatment that works takes some time, you try measures at home to relieve your discomfort.

-Warm baths and a heating pad can help relax

- *Pelvic muscles
- *Reducing cramping
- *Pain

-Over-the-counter nonsteroidal anti-inflammatory drugs (NSAIDs) such as:

- *Ibuprofen (Advil, Motrin IB, others)
- *Naproxen sodium (Aleve)

These can help ease painful menstrual cramps.

Alternative Medicine

Some report relief from endometriosis pain after acupuncture treatment. However, little research is available on this-or any other-alternative treatment for the endometriosis. If you are

interested in pursuing this therapy in the hope that it could help you, ask your doctor to recommend a reputable acupuncturist. Check with your insurance company to see if the expense will be covered.

Coping and Support

If you are dealing with endometriosis or its complications, consider joining a support group for women with endometriosis or fertility problems. Sometimes it helps simply to talk to other women who can relate to your feelings and experiences. If you can't find a support group in your community, look for one online.

Endometriosis & Holy Flower Studies

A study conducted at UCSF showed cannabinoids combined with opiates resulted in greater reduction of pain with a lower dosage of opiates than if the subjects didn't use cannabinoid. Chronic pain sufferers in this study reported up to a 33% reduction in pain despite being given a lower dose of their opiate pain relievers. Dr. Donald Abrams states their next step is to do another study including different medical marijuana types and potentially placebos so the results of this study can be confirmed.

The pain produced by endometriosis can only be described as chronic if the underlying condition is not treated. Therefore, long-term treatment is necessary. Over time, women who are taking prescription medications can become addicted to or experience less relief from these pain relievers. While tolerance to Holy Flower may increase over time, the risks of Holy Flower are far fewer than those of opiates.

There is no known risk of death from Holy Flower overdose or overuse, and it is not for lack of research. People have been using Holy Flower since the beginning of time, and there is not one single documented case of a medical emergency resulting from an overdose.

Everyone has an endocannabinoid system (ECS). This system contains CB1 and CB2 receptors, and in women, it is concentrated mostly in the uterus. Women with endometriosis have a CB1 production deficiency, making medical marijuana a good treatment option to relieve the pain by activating the CB1 receptors. Plus, unlike other treatments, Holy Flower doesn't produce the harsh side effects.

Endometriosis, Pain Management and Holy Flower Research

When it comes to endometriosis, women can experience painful periods at any time with:

- *Pain after or during sex
- *Cramps and abdominal pain before and during menstruation
- *Lower back or pelvic pain
- *Painful bowel movements

In addition to intense pain, many women also experience:

- *Extreme irritability
- *Vomiting
- *Fainting

Holy Flower has long been considered a treatment for pain management. There is also some evidence to suggest medical marijuana is helpful to use with opiates to keep opiate dosage low, and it appears to increase the effectiveness of opiates' pain reducing abilities as well.

Holy Flower is unlikely to work in the treatment of endometriosis itself. There is not any evidence to suggest medical marijuana can decrease the production of the uterine lining to any significant extent. Therefore, the only use medical marijuana can have in the treatment of endometriosis is in pain management. Numerous studies show Holy Flower has some pain-relieving properties appearing to vary by individual. Some people can experience significant relief from pain on Holy Flower, and other experience very little or none. Like all medications, people react in different ways.

The cannabis plants' cannabinoids can help alleviate most of your endometriosis symptoms such as:

- *Inflammation
- *Pain
- *Headache
- *Anxiety
- *Depression
- *Hypoglycemia
- *Fatigue

Consumption Methods of Holy Flower for Treatment Endometriosis

Listed are some preferred delivery methods of Holy Flower for endometriosis treatment:

Vaporizing

Women with endometriosis who are receiving hormonal treatments should not smoke -this includes smoking marijuana. The risk of deadly blood clots increases when you smoke. If you want to inhale your medical marijuana for endometriosis treatment, use a vaporizer instead. Smoking Holy Flower, like cigarettes, releases toxins which can not only diminish the healing.

Oil

Consuming cannabis oil doses can be an option if you are looking to switch cannabis from prescription medications. Cannabis oil can come in capsules, making it easier to swallow and obtain the correct dosage.

Tinctures

You may also buy preloaded oil syringe you squirt inside your mouth or place drops of a cannabis tincture under your tongue.

Edibles

Holy Flower is infused into the oil and in turn baked or cooked in your favorite foods or baked goods you already enjoy. Effects can be felt within 10 minutes up to an hour, and last anywhere

from 6-10 hours. As an edibles baker, cook, and creator of Sammy-Butter, the best advice I can give is to “start low and go slow”, meaning if you are new to Holy Flower, start with a lower milligram and slowly work your way up, as edibles can be quite potent and last for an extended period of time in your system. Unlike smoking, in which cannabinoids are inhaled into the lungs and pass rapidly into the bloodstream, whereas edibles are eaten and metabolize in the liver and pass through all the internal organs into the bloodstream. The result is significantly safer and longer lasting effects for those who suffer from Endometriosis

Topicals

Topicals are Holy Flower-infused products for use on the surface of the skin. They can come in the form of balms, lotions, oils, tinctures, or personal lubricants and can be applied directly to an affected area for fast-acting relief. Many infused topicals are strain-specific as well, which benefit specific health issues. Sativa or sativa-dominant strains will help improve circulation while indica or indica-dominant strains (these have a higher concentration of CBD) work well for pain, inflammation, and skin irritations. I have included my own tried and true recipes below to make at home. Topicals may also be purchased at a dispensary as well.

Holy Flower Body Lotion

- 1 cup of Holy Flower oil (Sammy-oil)
- 1 cup filtered water
- 4 tablespoons of grated beeswax
- 1 tablespoon of vitamin E oil
- Up to 12 drops of essential oil
- Mason jar
- Blender
- Clean, airtight storage jars for finished body lotion

Prepare Holy Flower Oil

After decarbing Holy Flower, use 3 cups of coconut oil adding 20 grams or more of Holy Flower on low heat for 3 hours, stirring every 15 minutes. Strain using cheesecloth. I recommend using a 5-cup glass measuring cup for the oil to be strained into. Cool the infused coconut oil and store in a dark place, covered.

Heat Holy Flower Oil and Beeswax

In a mason jar, combine 1 cup Holy Flower (Sammy-oil) and 4 tablespoons of grated beeswax. Fill a saucepan halfway with water. Put open, uncovered mason jar in the saucepan. Make sure water from the saucepan does not get into the mason jar. Heat over a low heat until the beeswax has melted, stirring the mixture occasionally. Remove the mixture from the heat.

Add Vitamin E and Other Essential Oils

Add up to 12 drops of essential oil and 1 tablespoon vitamin E oil. Blend thoroughly. Add one cup of water into the blender and blend at a medium speed. Open the top while blending and slowly pour in the Sammy-oil and beeswax mixture very carefully while blending. Put the top back on

the blender. Blend on medium speed for 2 minutes or until the water and oil/wax mixture are combined completely.

Store the Holy Flower Body Lotion

Put the Holy Flower body lotion into clean jars with airtight lids. Let the body lotion cool completely before closing the jars with airtight lids. This Holy Flower body lotion recipe make about 2 ½ cups or 20oz of lotion. It can be store in the refrigerator and has a shelf life of about 3 months

Using Holy Flower Body Lotion

After the Holy Flower body lotion has cooled completely, try the body lotion by applying it to the skin. There is no risk of overmedication with topicals, but it is still good advice to try small amounts and see how it affects your skin before applying to larger areas.

Put a small amount of the Holy Flower body lotion on a small area and wait a few hours to see how it affects you and to test the potency of the lotion. After testing the Holy Flower infused body lotion and its effects, apply more to larger areas as needed.

Holy Flower Infused Salve

- 1 cup of Holy Flower infused oil (Sammy-oil)
- 1 cup of Hemp oil or sunflower oil
- 4 tablespoons of grated beeswax
- 1 tablespoon of Vitamin E oil
- Up to 20 drops of essential oil
- Mason jar
- Clean airtight storage jars for finished Holy Flower salve

Prepare Holy Flower (Sammy-Oil)

After decarbing Holy Flower, use 3 cups of coconut oil adding 20 grams or more of Holy Flower on low heat for 3 hours, stirring every 15 minutes. Strain using cheesecloth. I recommend using a 5-cup glass measuring cup for the oil to be strained into. Cool the infused coconut oil and store in a dark place, covered.

Heat Oils and Beeswax

In a mason jar, combine 1 cup Holy Flower (Sammy-oil), hemp or sunflower oil and 4 tablespoons of grated beeswax. Fill a saucepan halfway with water. Put open, uncovered mason jar in the saucepan. Make sure water from the saucepan does not get into the mason jar. Heat over a low heat until the beeswax has melted, stirring the mixture occasionally. Remove the mixture from the heat.

Add Vitamin E and Essential Oil

Add vitamin E and essential oil to Holy Flower oil mix. Blend thoroughly until Holy Flower oil mixture is combined and smooth.

Store Holy Flower Salve

This recipe makes about 16oz of Holy Flower infused salve, divide between 2-8oz jars. Store at room temperature

Transdermal Patch

A transdermal patch is a discreet way of getting cannabis into your body. Patches are similar to nicotine or birth control patches. They are a great option if you aren't comfortable with vaping.

Juicing

Research shows that juicing is the best way to consume marijuana, and the majority of the conditions that can be treated by consuming juiced cannabis every day.

Thousands of patients have been successfully treated with juiced cannabis, and it's regularly used to treat chronic inflammation, lupus, arthritis, asthma, diabetes, hypothyroidism, autoimmune disorders, cellular dysfunction, and infections.

When juicing, freshness is very important, which is why you want to avoid dry, cured cannabis. If you are just getting started, consider juicing about 15 leaves, and to get psychoactive effects, toss a couple buds into the mix.

Holy Flower and Endometriosis

Like many pharmaceutical solutions, endometriosis treatments usually mask the symptoms but do little to treat the underlying cause. The body contains cannabinoid receptors known as CBI and CB2 (GPR55 is possibly a third). CBI receptors are found primarily in:

- *Fatty tissue
- *The liver
- *The brain
- *The vascular system

CB2 receptors are located in some areas of the brain and on immune cells throughout the body.

THC activates the brain's dopamine reward system via the CBI receptors. This reaction causes the intoxicating high and occasional feelings of euphoria caused by using cannabis. THC also activates CB2 receptors, which is a significant contributor to the cannabinoid's anti-inflammatory effects. Remember, endometriosis is an inflammatory disease. Meanwhile, CBD is potentially capable of desensitizing TRPV1, a pain receptor.

Holy Flower & Endometriosis- The Studies

A study by Dmitrieva et al., published in the Pain Journal in December 2010 looked at endocannabinoid involvement in endometriosis. The team found that CBI receptor agonists decrease, and CBI receptor antagonists increase, managing the pain associated with endometriosis in rats. The researchers wrote that this finding suggested the ECS "contributes to

the mechanisms underlying both the peripheral innervation of the abnormal growths and the pain associated with endometriosis.”

A study by Leconte et al., published in The American Journal of Pathology in December 2010, looked at cannabinoid agonists’ effects on endometriosis in mice. When they activated specific CB receptors in these mice, the team found that the receptors inhibited endometriotic tissue from increasing.

Armour et al., published a survey in BMC Complementary and Alternative Medicine in January 2019. Amongst 484 Australian women with endometriosis, cannabis was the most highly rated self-reported method of reducing pain.

Ongoing Research on Holy Flower for Endometriosis

The lack of funding means recent studies are few and far between. In April 2019, however, an Israeli company named Gynica announced its plans to begin preclinical studies to monitor cannabis’s effect on women with endometriosis. The goal is to find the best compound or combination of compounds to address the issue.

At present, women with endometriosis face a regular cycle of intense pain with few treatment methods available to combat it. Over-the-counter painkillers or opioid medications are one possible treatment option, but these may not work for everyone. Additionally, women with endometriosis face a five-figure sum to have surgery that isn’t guaranteed to succeed. As a result, cannabis may be one additional treatment option for some women try.

To fully understand how Holy Flower may treat endometriosis, an explanation of how endometriosis is affected by endocannabinoid system. This important an extensive system in our human bodies is made up of endocannabinoid receptors, CB1 and CB2, endocannabinoids, which are natural chemicals in the human body which activate or modulate CB1 and CB2 activity. Enzymes which metabolize the endocannabinoids also clear them from the body. The endocannabinoid system’s role is to maintain homeostasis, this keeps many of our most important functions in balance. Modulating functions like:

- *Sleep
- *Hunger
- *Pain
- *Anxiety
- *Nausea
- *Energy metabolism

The endocannabinoid is a vital system for maintaining our ongoing health.

The Endocannabinoid system is normally activated by our own internal endocannabinoids, they can also be stimulated by chemicals in Holy Flower called cannabinoids. Cannabinoids work similarly to our own natural endocannabinoids.

The endocannabinoid system is also involved in endometriosis and its associated pain. Researchers had suspected this might be the case because women reported reduced pain when using Holy Flower for their endometriosis. Specifically, scientists hypothesized that the endocannabinoid system was involved in both the development of endometriosis, and in the manifestation of its associated pain. Scientist found several pieces of evidence to support their theory. For one thing, studies have recently found that sensory and sympathetic nerve fibers actually sprout branches into these abnormal tissue growths, innervating them with sensation and allowing them to feel pain. These fibers are rich with CBI receptors, and thus can be modulated with endocannabinoids or the cannabinoids in cannabis (which can both activate CBI). Not only are the fibers and growths rich in CBI, but so are the neurons from which these fibers sprout.

Researchers explain that all of this could suggest that the endocannabinoid system plays an important role in the progression of endometriosis and the sprouting of innervating fibers.

We can also see in fertility research that higher levels of anandamide (a CBI stimulating endocannabinoid) at ovulation and lower levels at implantation is important for a successful pregnancy. Alterations in these endocannabinoids signaling can even lead to miscarriage, so we know that the endocannabinoid system plays an important role in the female reproductive system.

There is also a significant increase in endocannabinoid levels, along with decreased levels of CBI receptors, in women with endometriosis compared to those without endometriosis. This result suggests a negative feedback loop in pain regulation, which may impair the capability of the endocannabinoid system to control pain in endometriosis patients. All the evidence has even led some researchers to describe endometriosis as an “endocannabinoid deficiency” condition.

Medical Studies on Holy Flower and Endometriosis

The endocannabinoid system plays an important role in endometriosis but does that mean that Holy Flower can help treat it. To know for sure, we need to look at the research on cannabis, as a treatment for endometriosis in human subjects.

Holy Flower has an ancient tradition of being used as a medicine in obstetrics and gynecology. It is used historically to treat health issues including:

- *Dysmenorrhea
- *Dysuria
- *Hyperemesis
- *Gravidarum
- *Menopausal symptoms

And to this day, many women report positive effects from using Holy Flower for endometriosis pain.

At this time there are very few studies (and no clinical studies) which actually research the impact of cannabis on endometriosis in humans. Two recent survey-based studies which asked women suffering from endometriosis how Holy Flower worked for them.

The first study looked at women with endometriosis aged 18 to 45, who live in Australia. They asked about what types of self-management method the subjects used to work with their endometriosis symptoms, along with questions about changes in symptoms or medication use, costs, and adverse events. 76% of respondents reported using self-management techniques, and 13% of those subjects said they used Holy Flower. Those who did use Holy Flower reported high levels of pain reduction (7.6 of 10). With 56% also reporting pharmaceutical medications by at least half. These women reported the greatest improvements in:

*Sleep

*Nausea

*Vomiting

Adverse effects were relatively rare (10%) and minor. The authors of this study argue that these results warrant follow-up with more clinical studies to confirm cannabis' potential to treat endometriosis.

In another 2019 survey, patients responded to questions about their experience with cannabis and CBD (another cannabinoid) for the management of endometriosis and pelvic pain. The majority reported that it was moderately or very effective. Among both of the participant groups cannabis was most likely to be reported as very effective, which CBD was most likely to be reported as moderately effective.

This study gives more evidence of cannabis' helpful role for endometriosis and shows that it is a common treatment being used. It also sheds light on the relative efficacy between CBD and whole plant cannabis-suggesting that cannabis might be more effective than CBD alone.

The Best and Worst Foods for an Anti-Inflammatory Endometriosis Diet

An endometriosis diet may be the key to relief from the agonizing pain and inflammation. Registered dietician Courtney Barth, RD, explains which foods could help fight endometriosis symptoms and which ones make them worse.

How does Food Affect Endometriosis?

Inflammation and high estrogen levels can make endometriosis symptoms worse. And your diet can influence both factors. "Food plays an important role in helping your body fight inflammation and balance estrogen," says Barth. "Many people find that the right diet can significantly reduce endometriosis symptoms."

Fiber Helps Remove Excess Estrogen

Estrogen is a key hormone, and you need some of it for normal functioning. But too much estrogen can aggravate endometriosis symptoms like:

- *Cramping
- *Pain

That's where food and fiber can come to the rescue. "Your body gets rid of excess estrogen in the stool," explains Barth. "You should have a healthy bowel movement every day. If you don't you probably have constipation, and your estrogen levels could be too high." Kick constipation and extra estrogen to curb by filling up on fiber. "Adults should eat 35 grams of fiber every day," says Barth. You can boost your fiber by eating more:

- *Fruit and vegetables, but eat the whole food and avoid juice
- *Ground flaxseed, which you can add to smoothies or home-baked food
- *Legumes, like beans, lentils & chickpeas
- *Whole grains, like whole-wheat pasta and brown rice

Just be sure to increase your fiber intake gradually. "Adding a lot of fiber at once can cause bloating, gas and digestive discomfort," says Barth. "Raise your fiber intake slowly and drink plenty of water to minimize these side effects. Ground flaxseed is packed with fiber, so don't eat more than 3 tablespoons per day."

Fats that Fight Inflammation

Endometriosis is an inflammatory condition, so inflammation makes symptoms worse. Omega-3 fats can calm inflammation from endometriosis. Good food sources of omega-3s include:

- *Fatty fish, such as salmon, sardines, and tuna
- *Nuts and seeds, like walnuts, chia seeds and flaxseed
- *Plant oils, such as flaxseed oil and canola oil

Monosaturated fats also have anti-inflammatory power. They're found in:

- *Avocados
- *Nuts and seeds
- *Olive oil
- *Peanut butter
- *Safflower oil

Minerals that can help Relax Muscles and Regulate Your Cycle

Calcium gets a lot of attention as an important mineral. But if you have endometriosis, make sure you are also getting magnesium and zinc. "Magnesium helps with menstrual cramps," says Barth. "It's a natural muscle relaxer." Magnesium-rich foods include:

- *Dark chocolate (it is best to stick to small amounts, as it usually contains added sugar)
- *Leafy greens, like arugula, dark lettuce, kale, and spinach
- *Nuts and seeds, especially almonds and pumpkin seeds.

Zinc regulates your menstrual cycles, which is important for hormonal balance. “Zinc helps your body ovulate, or release an egg,” explains Barth. “When you ovulate, you produce progesterone which balances out estrogen. Ovulating is also necessary if you are trying to get pregnant.”

The highest sources of zinc are animal sources. So if you eat a vegetarian or vegan diet, ask your physician if you should take a zinc supplement. Good sources of zinc include:

- *Poultry, like chicken or turkey
- *Red meat, but limit this to two low-fat servings per week
- *Shellfish, like oysters, crab, and lobster

Foods to Avoid with Endometriosis

Certain foods can worsen endometriosis pain by boosting inflammation or estrogen level. Limit or avoid:

Alcohol

Alcoholic beverages make the symptoms of endometriosis worse. A maximum of one to two drinks per week. These include:

- *Wine
- *Beer
- *Spirits

Caffeine

Limit your daily caffeine to 400 milligrams or less. One cup of coffee can have over 100 milligrams, depending on how it is brewed.

Fatty Meat

Some red meat is good but limit your overall saturated fat intake to 10% of your daily calories.

Processed Foods

Many packaged foods containing pro-inflammatory ingredients like added:

- *Sugar
- *Saturated fat
- *Trans fat

They are also low in the minerals you need like:

- *Fiber
- *Zinc
- *Magnesium
- *Healthy fats

Sugary Drinks

Sugary drinks make inflammation worse such as:

- *Fruit juices
- *Sodas

*Energy drinks

They are high in sugar. It is best to aim for less than 26 grams of sugar each day.

Does Gluten or Dairy Make Endometriosis Worse?

Some people with endometriosis find that a gluten-free or dairy-free diet helps them feel better. But it depends on the person. “If you have tried eating healthier and it is not enough, then cutting out gluten or dairy is often the next step,” says Barth. “I usually recommend going gluten-free or dairy-free for at least a month. Then slowly add it back into your diet and see if your symptoms come back.”

You can also pinpoint problem foods with the low-FODMAP diet. FODMAP stands for fermentable oligosaccharides, disaccharides, monosaccharides, and polyols. FODMAPS are short-chain carbohydrates that you may have trouble digesting because:

*Your intestines can't digest and/or absorb them well

*Natural bacteria in your gut ferment them

*They draw extra water into your intestines

Despite these traits, not all FODMAPs are the enemy. “Chances are you can tolerate some or most FODMAP-containing foods,” says Dr. Cresci. “Plus, many healthy foods have FODMAPs in them, like dried beans/legumes, Brussel sprouts and apples. So, you don't want to cut out all high-FODMAP foods forever if they are not bothering you. You just want to avoid or cut back on the few that don't work for you.”

“The low-FODMAP diet is designed for people with irritable bowel syndrome, but it can work with endometriosis, too,” says Barth. “If you follow it closely, you might find that certain foods trigger your endometriosis symptoms.”

Can Supplements Help with Endometriosis

It might be tempting to pop some pills instead of updating your diet. But don't be quick to try supplements for endometriosis unless your physician gives you the go-ahead.

“Your physician can run tests to see if you are deficient in certain nutrients,” says Barth. “Then, if your physician recommends it, take supplements to fill any nutritional gaps. Supplements should be based on your health needs not a one-size-fits-all approach.”

Endometriosis Diet Recipes

Looking for some endometriosis friendly meals? Here are a few recipes to try:

Breakfast

A dairy-free breakfast with healthy fats and fiber is a great way to kick off your day. Try a tropical breakfast bowl.

Ingredients:

- *1 cup unsweetened almond milk
- *1 cup whole-grain oats
- *1/2 cup mango chunks
- *2 tablespoon chopped walnuts
- *1 tablespoon unsweetened coconut flakes

Directions:

- Combine the almond milk and oats in a small, microwave-safe bowl.
- Microwave on high for 6 minutes
- Stir, then let it stand for 2 minutes
- Top with the mango chunks, walnuts, and coconut flakes

Lunch

This black bean salad is chockfull of fiber and anti-inflammatory fats. Try this Black Bean Salad with Pico de Gallo Vinaigrette.

Ingredients:

- *1/2 cup brown rice (uncooked)
- *2 beefsteak tomatoes, diced
- *1 jalapeno, chopped
- *1/4 cup chopped fresh cilantro
- *2 tablespoon fresh lime juice
- *2 tablespoon extra-virgin olive oil
- *1/4 teaspoon kosher salt
- *1 head romaine lettuce, shredded
- *2 carrots, sliced into rounds
- *1 red bell pepper, sliced
- *1 ear of corn kernels shaved from cob
- *1 15 ounce can (no salt) black beans, drained and rinsed

Direction:

- In a small saucepan, combine the rice with 1 cup of water
- Bring to a boil, reduce heat to low, cover and cook until the rice is tender and the water is absorbed, 40-45 minutes
- Fluff with fork and let cool
- To prepare the vinaigrette, combine the tomatoes, jalapeno, cilantro, lime juice, oil, and salt in a medium bowl
- Divide the lettuce evenly among four bowls
- Top with the carrots, bell pepper, corn, beans, and rice
- Spoon the vinaigrette over the top of each bowl just before serving

Dinner

This baked fish recipe has healthy fats and a fiber-rich veggie. Try this baked fish with steamed butternut squash. Not only is this healthy and filling but it is ready in just 40 minutes.

Ingredients:

- *Fish (Striped bass, hake, haddock, cod, etc.)
- *2 teaspoons freshly chopped thyme
- *1 teaspoon sea salt

- *1/4 teaspoon freshly ground black pepper
- *2 teaspoons paprika
- *2 tablespoons extra virgin coconut oil
- *1 onion, thinly sliced
- *2 cups carrots peeled and cut into 1-inch pieces
- *3 cups butternut squash, peeled, seeded, and cut into 1-inch cubes
- *1 tablespoon coconut butter
- *1 teaspoon apple cider vinegar

Directions:

- Pre-heat oven to 350°F. Generously coat the fish with the olive oil. Combine the thyme, salt, pepper, and paprika, and then rub generously over the fish. Place the fish in a single layer in a baking dish. Place dish on the middle rack in the oven. Bake until cooked through, about 8-10 minutes.
- In a large pot, melt the coconut oil, then sauté the onion just until soft, about 2 to 3 minutes. Add the carrots and squash plus ½ cup water. Steam the squash and carrots until tender. Place the steamed vegetables in a food processor and pulse to break down, then add the consistency of mashed potatoes.
- Serve the fish over a good-sized portion of the squash puree.

Snack

When you need a bite between meals try this elemental granola recipe. It is full of nuts and seeds that pack plenty of good-for-you nutrients. Try this excellent Elemental Granola with pistachios, dried cherries, and vanilla.

Ingredients:

- *6 tablespoons maple syrup
- *6 tablespoons brown sugar (unpacked)
- *1/4 cup vegetable oil
- *1 teaspoon ground cinnamon
- *1/2 teaspoon salt
- *3 cups old-fashioned oats
- *1/2 cup sesame
- *1/2 cup raw whole macadamia nuts
- *1/2 cup shelled raw pistachios
- *1/2 cup sliced almonds
- *1/2 cup dried tart cherries, cranberries, or blueberries
- *1/2 cup sweetened shredded coconut

Directions:

- Pre-heat the oven to 250°F. Line a baking sheet with parchment paper
- In a large bowl, stir together the maple syrup, brown sugar, oil, vanilla, cinnamon, and salt until well-combined
- Add the oats, sesame seeds, macadamia nuts, pistachios and almonds and stir until the ingredients are evenly coated
- Spread the mixture into an even layer on the prepared baking sheet and bake until evenly gold on top, about 1 hour and 15 minutes, stirring every 20 minutes or so
- Let the granola cool on the baking sheet

-Add the dried cherries and coconut and toss to combine
The granola will keep in an airtight container at room temperature for up to one month.

Food is powerful medicine. Endometriosis can be debilitating, but one part of managing it could be as close as your kitchen. “If endometriosis is interfering with your life, try changing your diet,” says Barth. “It won’t hurt, and it could really help.”

Parts of the Holy Flower Plant

The following are the parts of the Holy Flower plant, including a brief description of each part:

Seeds

Seeds are produced in the female cannabis plants and carry the genetics of a male and female. Seeds need to germinate to sprout and will grow a taproot, which will become the main root that anchors the plant.

Cotyledon Leaves

These are the first leaves to grow from the seed after germination. They usually come in pairs and seeing them is a sign of successful germination and that your plant is on its way to growing healthy and strong.

Roots

The roots grow down from the main stalk of the plant into the soil. When growing from a seed, the main root is called the “taproot”. Roots are the lifelines of a cannabis plant, pulling water and oxygen into the plant so it can grow healthy and strong. Mycorrhizae, a beneficial fungus, can be added to soil to improve root system.

Stem

The main stem, or stalk, of the Holy Flower plant grows straight up from the root system and supports all lateral branches. The stem gives a plant structure and stability.

Often growers will top, or cut off, the stem after about five nodes, which forces the plant to grow laterally more, creating more bud sites.

Branches

Branches grow out of the main stem and support fan leaves and buds. Growers often train a cannabis plant by topping branches to create more bud sites.

Node

A node is a point at which a branch grows off the main stem, or one branch from another branch. Fan leaves and buds can grow on some nodes, but not necessarily all. When determining the sex of a cannabis plant, pre-flowers, or the beginnings of male and female sex organs, will appear at the nodes. The space between nodes is called “internodal spacing” and will give you a sense of whether a plant will grow tall or short.

Fan Leaves

Fan leaves are the large, iconic leaves of the cannabis plant. They capture light for the plant and typically have little-to-no resin and usually discarded when trimming.

Sugar Leaves

Sugar leaves are the small, resin-coated leaves that buds form around. Sugar leaves are usually saved as “trim” during harvest and can be used for pre-rolls, extracts, and other cannabis products.

Flowers

Also known as “Buds”, the flowers of a cannabis plant are the fruits of your labor. They contain the cannabinoids and terpenes and that get you high or offer.

Cola

A cola, also called a “bud site” refers to a cluster of buds that grow tightly together. While smaller colas occur along the budding sites of lower branches, the main cola-sometimes opical bud-forms at the top of the plant.

Bract and Calyx

Abstract is what encapsulates the female’s reproductive parts. They appear as green tear-shaped “leaves” and are heavily covered in resin glands which produce the highest concentration of cannabinoids of all plant parts. Enclosed by these bracts and imperceptible to the naked eyes, the calyx refers to a translucent layer over the ovule at the flower’s base.

Stigma and Pistil

The pistil contains the reproductive parts of a flower, and the vibrant hair-like strands of the pistil are called stigmas. Stigmas serve to collect pollen from males. The stigmas of the pistil begin with a white coloration and progressively darken to yellow, orange, red, or brown over the course of the plant’s maturation. They play an important role in reproduction, but stigmas bring very little to the flower’s potency and taste.

Trichomes

Despite their minute size, it is hard to miss the blanket of crystal resin on a cannabis bud. This resin is secreted through translucent, mushroom-shaped glands on the leaves, stems, and calyxes.

Plants originally developed trichomes to protect against predators and the elements. These clear bulbous globes ooze aromatic oils called terpenes as well as therapeutic cannabinoids like THC and CBD. The basis of hash production depends on the trichomes and their potent sugar-like resin.

What are Cannabinoids?

Cannabinoids are natural chemical compounds found in a viscous resin produced in glandular trichomes in the cannabis plant. They interact with your body through receptors that are part of our natural endocannabinoid system.

Cannabis Sativa contains about 600 different molecules, but out of these there are about 140 classified as cannabinoids. They are the alkaloid compounds in cannabis that can influence your body's natural endocannabinoid system. There are three main classifications of cannabinoids:

Phytocannabinoids

Found in cannabis stalks, leaves, flowers, seeds, and resin

Endocannabinoids

Cannabinoids made by the body

Synthetic Cannabinoids

Lab-created cannabinoids (like prescription medications)

What do cannabinoids do? Cannabinoids bind to natural receptors (cells that react to proteins and other molecules) in our central nervous system and peripheral nervous system. The receptors are specific cells located in our brain and nearly everywhere else throughout the body. The main cannabinoid receptors are:

*CB1

*CB2

Some cannabinoids bind to CB1 receptors which are located primarily in the brain and throughout the central nervous system. The best-known cannabinoid, THC, binds with these receptors and produces the euphoric psychoactive effects people are most familiar with from using marijuana.

The second best-known cannabinoid, CBD, interacts primarily with CB2 receptors. CBD's effects are physical not psychoactive.

Endocannabinoid System (ECS)

What is the endocannabinoid system or ECS? The endocannabinoid system (ECS) regulates skin health. The cannabinoids in Holy Flower interact with the endocannabinoid system to improve skin health. Our bodies have a large endocannabinoid system that includes specialized receptor cells in the brain and throughout the rest of our bodies, including:

*Digestive system

*Connective tissue

*Organs

*Glands

*Muscle

*Immune cells

*Skin

The endocannabinoids are literally a bridge between body and mind. It is a natural

Part of the body, and our bodies make endocannabinoids naturally in addition to the cannabinoids that are present in cannabis. The ECS is active and present in our daily lives whether or not we use cannabis or cannabinoids. The ECS includes the cannabinoid receptors CB1 & CB2, and they have an influence on complex body functions. Cannabinoids and endocannabinoids bind to receptors and help to regulate how our body functions. Some cannabinoids can help manage other substances from influencing the receptors and body functions. Overall, research has shown that the ECS is linked to the following processes in the body:

- | | |
|----------------------------------|-------------------------|
| *Appetite and digestion | *Sleep |
| *Metabolism | *Cardiovascular system |
| *Pain | *Muscle formation |
| *Inflammation & immune responses | *Bone growth and health |
| *Reproductive system & fertility | *Mood |
| *Motor control | *Stress |
| *Memory & learning | *Skin & nerve function |

The main function of the endocannabinoid system is to help our bodies maintain homeostasis, which is a biological or medical term that refers to stability and the ability to function healthily in your environment.

How Do Cannabinoid Receptors Work?

Our bodies have two main types of cannabinoid receptors:

- *CB1
- *CB2

It is possible there may be more types of receptors that haven't yet been discovered.

Cannabinoid receptors are influenced by cannabinoids in different ways. For example, THC binds to both CB1 and CB2 receptors and affects both the brain and the body. CBD doesn't bind to CB1 or CB2 the same way THC does. It reacts with the ECS in a more complex way that is still researched. Its effects may include a variety of potential physical and mental benefits. It is currently being studied for potential uses ranging from supporting regular sleep patterns to reducing anxiety and improving concentration.

The Health Benefits of Cannabinoids

The ECS influences all our body functions including, homeostasis or balance, that cannabinoids might have almost limitless health benefits. Here is a list and brief description of the more well-known cannabinoids:

CBD

Cannabidiol (CBD) is known globally and found in thousands of different products. CBD works in the body in a complex way, and it's primarily bioactive, not psychoactive. CBD in Holy Flower may be effective for Darier's disease by blocking CB2 receptors to eliminate some allergic responses in the skin that cause flare-ups.

THC

Tetrahydrocannabinol (THC) binds to both CB1 and CB2 receptors, and it has psychoactive and physical (bioactive) effects. Its best-known effect is intoxication, or the “high” effect experienced by users, as well as appetite improvement, pain, reducing anxiety and supporting comfort.

CBGA

Cannabigerolic acid (CBGA), like CBD, doesn't tend to cause a feeling of intoxication. Some researchers call CBGA “the mother cannabinoid” because it is a precursor for some other cannabinoids. Research is ongoing to discover if it can relieve anxiety and physical discomfort, and combat inflammation and infection in humans.

THCA

Δ^9 -tetrahydrocannabinolic acid, THCA, is found on the living cannabis plant. The compound slowly turns into THC as the plant ages and quickly becomes THC when it is heated (smoked or vaped). Research is just starting on THCA, but it is generally known to be non-intoxicating. Reports show it could have benefits for inflammation and neuroprotection for degenerative neurological diseases. Early studies are being conducted to determine whether THCA could potentially:

- *Reducing nausea
- *Improve appetite
- *Slow the spread of prostate cancer

CBDA

Cannabidiolic acid, CBDA, is another compound found in living cannabis plants. CBDA doesn't bind to CBD1 or CBD2 receptors. Instead, it inhibits enzymes that influence the ECS system.

CBCA

CBCA, Cannabichromenic acid, is a precursor to CBC, and it is also another chemical step descended from CBGA. CBC is one of the phytocannabinoids that comes from the cannabis plant. CBGA was first discovered in 1966, but research into its benefits is currently limited.

CBGVA

CBGVA, Cannabigerovaric acid, is the precursor of CBGV or cannabigerovarin. Like the other acid precursors, it is found in the living cannabis plant or raw cannabis flower and transforms when exposed to heat. It is non-psychoactive, like most cannabinoids. However, research is very limited on this cannabinoid, so its effects are not well known.

THCVA

THCVA, Tetrahydrocannabivarinic acid, is a precursor to THCv, tetrahydrocannabivarin, and is like the other cannabinoids that come from the raw flowers of the cannabis plant. THCVA can potentially reduce inflammation. THCv has been studied more than THCVA, and some research studies show that it can have benefits in reducing overeating and obesity.

CBDVA

CBDVA, Cannabidivarinic acid, is the chemical precursor to CBDV, and both are similar to CBD (cannabidiol). Like other cannabinoids, remains under study, though it is known that CBDVA is not intoxicating.

CBCVA

CBCVA, Cannabichromenvarinic acid, is considered one of the major acids found in the cannabis plant, and like other cannabinoids found in the living plant, it isn't thought as psychoactive/intoxicating.

The National Center for Complementary and Integrative Health reports that lab-created cannabinoid drugs (approved by the FDA) can be used to manage:

- *Epilepsy
- *Nausea
- *Vomiting
- *Weight loss
- *Loss of appetite

A 2017 study conducted by the National Academies of Science, Engineering and Medicine concluded that there was conclusive, substantial evidence that cannabinoids from the cannabis sativa plant could benefit:

- *Nausea and vomiting
- *Muscle spasticity

They also found moderate evidence for cannabinoids benefitting:

- *Sleep outcomes in people with obstructive sleep apnea
- *Muscle spasms
- *Potential pain relief

Further continuous research is ongoing for:

- *Increasing appetite
- *Decreasing weight
- *Improving clinician-measured MS symptoms (as opposed to patient reports)

History of Holy Flower Use

Holy Flower dates to the beginning of time. Starting in the book of Genesis 1:12, starting, "and the earth brought forth grass, and herb yielding seed...God saw that it was good." Another bible verse from Genesis 9:3 states, "Every moving thing that lives shall be food for you. And as I give you the Green plants, I give you everything." God said it Himself, he put Holy Flower on our earth to use for our health and in many forms for our benefit.

Jesus was the very first advocate for the use of Holy Flower and to treat the sick and suffering with many health issues. In the Guardian a study of scriptural texts suggests that Jesus and his disciples used Holy Flower to carry out and perform miraculous healings. The anointing oil used

by Jesus, who certainly was a cannabis user, and his disciples, contained an ingredient called Kaneh-bosem which has since been identified as cannabis extract, according to an article by Chris Bennett in the drug magazine High Times, entitled Was Jesus a Stoner? The incense used by Jesus in ceremonies also contained a cannabis extract, suggests Mr. Bennett, who quotes scholars to back his claims.

Carl Ruck, a professor of classical mythology at Boston University states, "There can be little doubt about a role for cannabis in Judaic religion." Referring to the existence of cannabis in anointing oils used in ceremonies. He added, "Obviously the easy availability and long-established tradition of cannabis in early Judaism would inevitably have included it in the (Christian) mixtures.

Another profound statement from Mr. Bennett suggests those anointed with the oils used by Jesus were "literally drenched in this potent mixture although most modern people choose to smoke or eat the Holy Flower, when its active ingredients are transferred into an oil-based carrier, it can also be absorbed through the skin."

Quoting the New Testament, Mr. Bennett argues that Jesus anointed his disciples with the oil and encouraged them to do the same with the other followers. This could have been responsible for healing eye and skin diseases referred to in the Gospels.

This powerful and truthful statement from Mr. Bennett concludes, "If cannabis was one of the main ingredients of the ancient anointing oil and receiving this oil is what made Jesus Christ and his followers Christians, then persecuting those who cannabis could be considered anti-Christ." I couldn't agree more with this statement.

Holy Flower has been used globally dating back for centuries throughout India, China, Africa, and Assyria. It was used for medicinal, spiritual, and recreational purposes.

Medicinal use of Holy Flower dates back at least 5,000 years, as such cannabis history is tied to many iconic time periods. Examples of this are:

- The ancient Egyptians reportedly used marijuana to treat glaucoma as well as general inflammation.
- Chinese Emperor Fu His called cannabis a popular medicine in 2900 BC, and the Chinese had identified more than 100 medical uses for Holy Flower by 100 AD.
- In 1,000 BC, the Indians created a drink called Bhang, a mixture of marijuana, milk, and other ingredients, and used it as anti-phlegmatic and anesthetic. This drink is currently used in India.

Like Jesus, ancient Indians have used Holy Flower as a cure for:

- *Leprosy
- *Dysentery
- *Cure fever
- *Insomnia
- *Improve judgement & cognition

It is also thought to prolong healthy life. Other ancient cultures also used Holy Flower. The ancient Greeks used it for:

- *Inflammation
- *Earaches
- *Swelling

In 70 AD, Roman medical texts listed it as a cure for earache and as a way to suppress sexual desire. The Romans also boiled the roots of the plant and used them as a treatment for:

- *Gout
- *Arthritis
- *Generalized pain

The Arabians used it from 800 AD to 900 AD for:

- *Migraines
- *Syphilis
- *Pain

The English also documented many medicinal uses of Holy Flower for ailments, such as:

- *Menstrual cramps
- *Convulsions
- *Rheumatism
- *Gout
- *Joint pain
- *Muscle spasms
- *Insomnia and sleep problems
- *Childbirth (to promote uterine contractions)

Spiritual History of Holy Flower

Holy Flower has a very long history spiritually. It is said the Hindu god Shiva rested under a cannabis plant and ate its leaves following a family argument. Sounds to me a great way to overcome the tension and stress of any heated situation. Shiva is referred to as the Lord of Bhang. The Vedas, a collection of ancient scriptures, refer to Holy Flower as an herb to release people from anxiety. One story in the Vedas describes a drop of heavenly nectar falling on the earth and becoming the cannabis plant.

In his Histories, Greek Historian Herodotus described cannabis being smoked for spiritual, emotional, and sometimes recreational purposes. He discussed groups coming together and smoking, stating that the people smoking marijuana would “howl with pleasure!”

Marijuana has had a long and very rocky past in the United States since this country was formed. Originally used as a textile material and later a medicinal ingredient, this awesome plant became highly controversial through the years. Below is the Holy Flower timeline in the United States:

1600s

The origins of marijuana in the United States can be related back to the earliest days of settlement when hemp was grown like any other crop. In the 17th century, the production of hemp-a variety of the cannabis plant-was highly encouraged to make:

- *Clothing
- *Rope
- *Sails

In 1619, the Virginia Assembly passed legislation requiring that all farms grow hemp. Some states even traded hemp as legal tender.

1700s

George Washington, our first United States president, was interested in farming hemp. But he also questioned the potential of marijuana in his journals in 1765.

1840

Marijuana became widely accepted in mainstream medicine and was an ingredient in many over-the-counter products.

1850

Holy Flower was added to the U.S. Pharmacopeia. It was used as a treatment for:

- *Opioid withdrawal
- *Pain
- *Appetite stimulation
- *Relief of nausea and vomiting

1862

Hashish candy was advertised in an issue of Vanity Fair as a pleasurable and harmless stimulant that could cure melancholy and nervousness.

1906

The Food and Drug Act required that any product containing cannabis be labeled appropriately.

1900-1930

For 3 decades, Holy Flower was an ingredient in a variety of medications. It was marketed as a painkiller but was also used for sedation and to treat muscle spasms. However, during this same time, Mexican immigrants introduced recreational use of marijuana. Because the drug became associated with Mexican Immigrants, people began to fear the drug, anti-drug campaigners who were clearly ignorant referring to it as the “Mexican Menace.”

1914-1925

Twenty-six states passed laws prohibiting marijuana. These laws passed readily and easily with little to no public outcry or political debate.

Even those this was a century ago, and research was not so readily at our ancestors' fingertips, in my opinion, the laws passing prohibiting Holy Flower with the American people in such a

passive state of being and clearly not awakened to the fact of the plethora of benefits the glorious plant has which has been proven by many generations on a global scale. Instead of just going along with a person's belief in it being harmful or evil as some have said, take the time to educate yourself by truly weighing the pros and cons and reviewing factual evidence from the many documented sources available. Let's continue.

1930s

The Great Depression resulted from job loss for many Americans. This created more fear and stigmatization of Mexican immigrants as many Americans worried, they would take away their jobs. This led to more public concern over the dangers of marijuana. The media began to report that research showed that marijuana use was linked to "crime and violence". At the same time, Harry Anslinger, commissioner of the Federal Bureau of Narcotics, began a campaign to criminalize marijuana, claiming that it led to insanity. That statement alone is insane. As a result of his efforts, by 1936, all states had some form of marijuana regulation laws.

1936

The film Reefer Madness was released. It depicted marijuana as a drug that could lead to:

- *Violence
- *Rape
- *Suicide
- *Psychosis

1937

The Marijuana Tax Act was passed which restricted marijuana use to only those that could pay a heavy excise tax for specific authorized industrial and medical uses.

1942

Marijuana was removed from the U.S. Pharmacopoeia and doctors began to discredit marijuana as not having any medicinal use.

1944

The New York Academy of Medicine published a report stating that marijuana was only a mild intoxicant. Harry Anslinger responded to this report with a solicited article in the American Journal of Psychiatry that attempted to attack and discredit the information they had previously published.

1952

The Boggs Act passed, creating strict mandatory punishments for offenses involving marijuana and a variety of other drugs.

1960s

Marijuana gained popularity among the counterculture who considered it a harmless high. Its use was popular among college students, free-spirited, anti-war activists, hippies, and other youth. President John F. Kennedy and Vice President Lyndon Johnson commissioned reports that found that marijuana did not induce violence or lead to use of other more dangerous drugs.

1965-1970

Marijuana arrests on the state level increased tenfold as authorities began to crack down on marijuana use and distribution.

1970

Congress passed the Controlled Substances Act, which placed marijuana as a Schedule I drug along with LSD and heroin. According to the act, marijuana had no medicinal value, and a high potential for abuse, giving it harsher criminal penalties. This law made it difficult for doctors and scientists to study marijuana and its many uses. Despite federal efforts to strengthen enforcement of strict marijuana laws, states the following all decriminalized such as:

*Oregon

*Maine

*Alaska

1972

The Shafer Committee recommended that personal use of marijuana be decriminalized. But President Nixon ignored their recommendations.

1976

The parents' movement against marijuana began, as more and more parents feared the drug and sought to prevent use in teens. Their efforts were strengthened by the Drug Enforcement Administration and the National Institute on Drug Abuse.

1980s-1990s

The public opinion of marijuana shifted back to it being dangerous, as many considered it a gateway drug to harder drugs such as:

*Cocaine

*Heroin

1982

First Lady Nancy Reagan started the "Just Say No" campaign.

1983

The Drug Abuse Resistance Education (DARE) program was established, which brought police officers into schools to discuss the dangers of drug abuse. Funding and use of this program was later cut back as research showed that it did not lead to decreased drug use in youth.

1986

President Ronald Reagan signed The Anti-Drug Abuse Act. This law raised marijuana penalties and created mandatory sentences many of which equated marijuana with heroin.

1989

President George H.W. Bush declared a “New War on Drugs” and continued anti-marijuana campaigns.

1996

California voters approved Proposition 215, which legalized marijuana for medicinal use at the state level.

1998-1999

The Clinton Administration spent \$25 million on television campaigns that placed drug messages in primetime TV shows.

Marijuana remains illegal under federal law in the United States, although the laws on the state level are increasingly changing more than 20 states now permit the sale of Holy Flower, either medical or medical and recreational, in various forms to inhale, consume or prescription form. There presently two FDA approved medications on the market:

- *Marinol (Dronabinol)
- *Cesamet (Nabilone)

Both are synthetic cannabinoids used to treat nausea or neuropathic pain. Other drugs in clinical testing are:

- *Epidiolex-used to treat childhood seizures
- *Sativex-for cancer pain

In 2014, Colorado was the first state to legalize Holy Flower recreational use. Alaska, California, and Washington followed suit. Along with Massachusetts and Washington D.C. as well as Nevada deciding recreational being legal is the only way to go.

While Holy Flower is still unfortunately illegal on the federal level, doing the scientific research for medicinal purposes has been made rather difficult as well as dispensaries running the risk of being close down by the Drug Enforcement Administration. As time progresses and the more people in general across the country are urging lawmakers to pass legalization, the more states will become legal not only for medical patients but also for recreational use.

Holy Flower Strains by Symptom category

On the following pages I have compiled researched lists of Holy Flower by symptom category. The strains are listed alphabetically including the THC percentage from lowest to highest percentage. The strain types include:

- Indica and Indica-Dominant strains (I and I-D)
- Sativa and Sativa-Dominant strains (S and S-D)
- Hybrid (50/50 Indica/Sativa) (H)

Indica and Indica-Dominant Strains

Indica and indica-dominant strains effects include:

- *Body melt-effortless muscle loosening
- *Couch lock-a willingness to stop, be still, and in the moment
- *Munchies-Expect an intense desire to eat
- *Sedative-a gentle nudge towards sleep
- *Laid back-cool & collected mood (anxiety lifter)
- *Works well for pain relief
- *Helps to relieve stress
- *Best for evening and nighttime use

Sativa and Sativa-Dominant Strains

Sativa and sativa-dominant strain effects include:

- *Head high
- *Alertness
- *Uplifting & euphoric
- *Creativity
- *Increased energy
- *Energetic and uplifting
- *Spacey, cerebral, and hallucinogenic
- *Stimulates appetite
- *Relieves depression
- *Best for morning and daytime use

Hybrid strains are a 50/50 cross between indica and sativa strains. The main symptoms of endometriosis include:

- *Pain
- *Inflammation
- *Insomnia
- *Anxiety
- *Depression
- *Gastrointestinal

If you are new to Holy Flower, it is best to experiment with different strains to find the ones that are right for you. Not every strain works for every single person or their lifestyle. You can purchase your Holy Flower at your local dispensary where the budtender can further assist you. Be mindful that every strain on the lists will not necessarily be available at every dispensary, so it is best to preview the dispensary's menu prior to ordering. If you have a green thumb, you may be interested in growing your own Holy Flower by purchasing the seeds from a reputable company. Listed below are the top ten listed online for 2023.

1. **ILGM** - Best US seed bank overall (**free shipping**)
2. **Seedsman** - 4,400+ cannabis seeds
3. **Crop King Seeds** - 24/7 live chat and toll-free number
4. **Herbies Seeds** - High-THC (33%+) seeds
5. **Seed Supreme** - 100+ landrace and Kush strains

6. **Rocket Seeds** - 20+ breeders worldwide
7. **Quebec Cannabis Seeds** - Great seeds for short seasons
8. **Mary Jane's Garden** - Good high-CBD seeds
9. **Sonoma Seeds** - Helpful customer service
10. **Beaver Seeds** - High germination rate
